## ABSTRACT

This volume contains 30 indicators that collectively describe the condition of postsecondary education from a variety of perspectives. The indicators have been derived from studies conducted by the Center for Education Statistics and from other surveys conducted both within and outside the Federal Government. Indicators have been grouped under the headings of student progression and outcomes; context; and resources. Outcome indicators describe student access and participation; persistence; educational attainment and curriculum; continuation to advanced levels; and economic outcomes. Context indicators provide measures of the changing characteristics of higher education, both in terms of its institutions and its students (race/ethnicity and age). Resource indicators focus on fiscal resources (institutional revenues, penditures per student, and financial aid) and numan resources (facuity salaries and teaching wcrkloads). Also included are measures of two outputs of postsecondary education: degrees and research. For postsecondary education, new indicators include the following: (l) net cost of college attendance; (2) timing of entry to college; (3) baccalaureate field of study, by sex; (4) starting salaries of college graduates; and (5) time allocation and workload of full-time faculty. Among the key issues discussed in the overview are minorities and women in higher education, and access, persistence, and completion rates. (MLF)

U.S. Department of Education, National Center for Education Statistics. The Condition of Education, 1991, Volume 2, Postsecondary Education. Washington, D.C.: 1991.

June 1991

[^0]The National Center for Education Statistics (NCES) gathers and publishes information on the status and progress of education in the United States. The federal authorization for these activities (with antecedents to 1867) states that the Center will "collect, collate, and from time to time, report full and complete statistics on the condition of education in the United States." The Hawkins-Stafford Elementary and Seconda'y School Improvement Amendments of 1988 (Public Law 100-297) mandates an annual statistical report on the subject from the Commissioner of Education Statistics. This 1991 edition of the Condition of Education responds to the requirements of law.

The condition of education "indicators"-key data that measure the health of education, monitor important developments, and show trends in major aspects of education-are published in separate volumes; one for elementary and secondary education and one for postsecondary education. Both volumes include the text, tables, and charts for each indicator plus the technical supporting data, supplemental information, and data sources.

The indicators presented in these volumes have been developed using data from studies carried out by NCES as well as from suncys conducted elsewhere, both within and outside the federal government. Although indicators may be simple statistics, more often they are analyses-examining relationships; showing changes over time; comparing or contrasting subpopulations, regions, or states; or studying characteristics of students from different backgrounds. Data used for these indicators are the most valid and representative education statistics available in the United States today for the subjects and issues with which they deal.

The indicators portrayed here are selective. No more than 60 indicators are presented in each year's two-volume report. By contrast, the Center's other major annual compendium, The Digest of Education Statistics, included more than 380 statistical tables, plus figures and appendices in its 1990 edition. These indicators represent a consensus of professional judgment on the most significant national measures of the condition and progress of education at this time, but tempered, necessarily, by the availability of current and valid information. They reflect a basic core that can be repeated with updated information every year, supplemented by a more limited set of indicators based on infrequent or one-time studies.

This year, for elementary and secondary education, new indicators include:

- High school completion ra'zs at ages 19, 25, and 29;
- Employment rates of recent high school graduates and dropouts;
- Mathematics and science course-taking patterns among high school students;
- Certification and education of full-time public secondary school teachers;
- International comparisons of public expenditures for elementary and secondary education.

Fcr postsecondary education, new indicators include:

- Net cost of college attendance;
- Timing of entry to college;
- Baccalaureate field of study, by sex;
- Starting salaries of college graduates;
- Time allocation and workload of full-time faculty.

The concept of education indicators has gained the attention of the U.S. Congress, national organizations, states, and localities. To assist the Center in conceptualizing and developing a set of education indicators most useful to policymakers and researchers, the Congress mandated that NCES convene a special study panel of experts to "make recommendations concerning the determination of education indicators for study and report" (Public Law 100-297). The report of the panel will be ready for Congress in the summer of 1991. Its recommendations could result in structural or contents changes for the 1992 and subsequent editions of The Condition.

In developing indicators, the Center has participated in a widening national discussion about the types of measures that are useful in monitoring the progress of education. The adoption of a set of National Education Goals by the President and the Nation's Governors was accompanied by a commitment for annual reporting on progress toward the goals. The National Education Goals Panel, currently chaired by Governor Roy Romer of Colorado, is charged to make recommendations in September 1991 for appropriate measures, or indicators, by which the Nation can monitor the goals. A number of local education agencies and states, such as California and Connecticut, are monitoring their own reform agendas through education indicators. Also, at the national level, the Council of Chief State School Officers seeks to have consistent reporting by the States on a number of indicators that it has identified

The utility of The Condition should continue to increase as more diverse, high quality data become available, especially as new time series can be constructed. Elementary and secondary education data will be enhanced by revisions in the basic data collected about public schools in the Common Core of Data survey. Two data systems recently begun at the Center are the basis for new indicators in the elementary and secondary volume: the Schools and Staffing Survey (SASS), which
covers both public and private schools, and the National Education Longitudinal Study of 1988.

Data collection from more postsercondary institutions than the traditional accredited 2- and 4 -year colleges and universities has already begun. This expanded system, called the Integrated Postsecondary Education Data System, also includes information from nonaccredited institutions whether they are public or private, 4 -year, 2-year, or less-than-2-year. Information from this broader grnup of institutions will provide a much clearer picture of what is happening in the full scope of posisecondary education. Two other data systems recently begun at the Center are the basis for new indicators in the postsecondary volume: the National Postsecondary Student Aid Study (NPSAS) aind the National Survey of Postsecondary Faculty (NSOPF).

Finally, the format of The Condition of Education is designed to present statistical information in an accessible manner for a general audience. The essence of each indicator is on two facing pages. On the first page, the results are highlighted and a table presents the data. On the second page one or more charts give a graphic representation to the major implications of the indicator. An innovation of this ecition is the addition of color to the charts. In addition, there is a discussion preceding each group of indicators relating them to one another. As in previous years, additional tables supporting each indicator are placed in arı appendix.

I hope you find the material helpful and invite you to send us comments or how to make future editions even more useful.
E.merson J. Elliott

Acting Commissioner of
Education Statistics

The Condition of Education was prepared in the National Center for Education Statistics (NCES), Office of Educationa! Research and Improvement (OERI), by the Indicators and Reports Branch of the Data Development Division.

Many individuals contributed to the preparation of this report. Brenda Wade prepared the charts. James J. Corina, Robert Craig, and Frank Schneider of Pinkerton Computer Consultants, Inc. provided substantial computer support including creation of analysis files from the 1974 through 1989 October Current Population Surveys (used for several indicators including Indicator 2:25), processing the National Survey of Postsecondary Faculty used for Indicators 2:29 and 2:30, processing of the National Postsecondary Student Aid Study for Indicator 2:4 and 2:28, and processing of the 1989 and 1990 March Current Population Surveys for Indicator 2:19. Thomas Snyder developed Indicators 2:26 and 2:27 and updated them for this edition. We are especially grateful to Yupin Bae of Pinkerion Computer Consultants, Inc. She provided the majority of the computer support including processing the Recent College Graduates Surveys ior Indicators 2:6, 2:14, and 2:17; creation of the tables on the basis of the computer runs; modification of the charts for the addition of color; and preparing files to produce the camera-ready art.

From outside the Department of Education, the following people provided help in the collection and interpretation of data: Jay Noell of the Congressional Budget Office; Sharon R. Cohany and Wayne Howe from the Bureau of Labor Statistics; Lori Thurgood of the National Research Council; Jeffroy Thomas from the National Endowment for the Humanities; Susan Hill, Marge Miachen, and Miles Boylen from the National Science Foundation.

Several people were invited to review the plan for the 1991 edition of The Condition of Education and made valuable suggestions. They were: Rolf Blank of the Council of Chief State School Officers; Elaine El-Khawas of the American Council on Education; Alan Ginsburg of the Office of Planning, Budgeting, and Evaluatior in the U.S. Department of Education; Charles S. Lenth, Director of the State Higher Education Executive Officers (SHEEO)/Nationa! Center for Education Statistics Communication Network; and Jeanne McDonald of the Natiorial Gove nors Association.

This volurne tias been reviewed by many people, often within very tight time constrairts and at the expense of their many other responsibilities. Their high professional standards, discerning eyes, and commitment to quality are crucial to the usefulness and relevance of the volume. In OERI, John Burkett, Mary Frase, and Jeanne E. Criffith reviewed the entire manuscript. OERI staff who reviewed portions of the manuscript were: Susan Ahmed, Bob Burton, Dennis Carroll, Michael Cohen,

William Freund, Debra Gerald, William Hussar, Andrew Kolstad, Roslyn Korb, and Doug Wright. An agency review was conducted by the Office of Planning, Budget, and Evaluation.

Several individuals served as invited external peer reviewers of the draft manuscript and made valuable contributions. They were: Clifford Adelman of the Office of Research of the U.S. Department of Education, Charles Andersen and Deborah J. Carter of the American Council on Education, John Bishop of Cornell University, Robert Huelskamp of Sandia National Laboratories, and Charles Lenth of the SHEEO/NCES Communication Network.

## Indicator 2:1

2:1-1 Percent enrolled in college in October following high school graduation, by sex, type of college, and race/ethnicity: 1968-1988 (3-year averages) ..... 102
2:1-2 Percent enrolled in college in October following high school graduation, by sex, type of college, and race/ethnicity: 1967-1989 ..... 103
2:1-3 Standard errors for estimated percentages in table 2:1-1 ..... 104
2:1-4 Standard errors for estimated percentages in table 2:1-2 ..... 105
Indicator ..... 2:2
2:2-1 Date of first enrollment in postsecondary education among 1982 high school graduates who enrolled betore 1986, by race/ethnicity and type of institution ..... 106
2:2-2 Date of first enroilment in postsecnridary ecucation among 1980 high school graduates who enrolled before 1984, by race/ethnisity and type of institution ..... 107
2:2-3 Date of first airollment in postsecondary education among 1972 high school graduates who enrolled before 1976, by race/ethnicity and type of instieution ..... 108
SN 2:2 Continuation to college rates ..... 109
Indicator 2:3
2:3-1 Average undergraduate tuition, room, and board as a percent of income of families with children under 18, all 6-17 years old, at selected family income percentiles, by control of institution: 1975-1989 ..... 111
2:3-2 Average undergraduate tuition, room, and board in constant 1990 dollars and as a percent of the income of all families ai selected family income percentiles, by control of institution: 1964-1989 ..... 112
Indicator 2:4

2:4-1 Average total, net, and adjusted net cost of college attendance and expected family contribution (EFC) for dependent, full-time, full-year undergraduate college students, by type and $c=n t r o l$ of institution and family income: Academic year ending 1987113
2:4-2 Number of dependent, full-time, full-year undergraduates and their net and adjusted net cost of college attendance as a ratio of expected family contribution (EFC), by type and control of institution and family income: Academic year ending 1987 ..... 114
2:4-3 Selected percentiles of the ratio of net cost and adjusted net cost to expected family contribution for dependent, full-year, full-time. undergraduates, by type and control of institution and family income: Academic year ending 1987 ..... 115
2:4-4 Standard errors table for estimates in table 2:4-1 ..... 116
2:4-5 Standard errors table for estimates in table 2:4-2 ..... 117
SN 2:4 Net cost of college attendance ..... 118
Indicator 2:5
2:5-1 Standard errors for estimated percentages in text table for Indicator 2:5 ..... 120
2:5-2 Continuous attendance and grade level progression rates, by sex, race/ethnicity, and grade level the previous October: Ociober 1989 ..... 121
2:5-3 Standard errors for estimated percentages in table 2:5-2 ..... 122
SN 2:5 Persistence rates ..... 123
Indicator 2:6
2:6-1 Time between high school graduation and award of the baccalaureate degree, by race/ethnicity, sex, and field of study: Years of college graduation 1977 and 1986 ..... 124
2:6-2 Standard errors for estimated percentages in table 2:6-1 ..... 125
Indicator 2:7
2:7-1 Percentage of high school graduates 25-29 years old who have completed 4 years of college or miore, by race/ethnicity and sex. 1965-1990 ..... 126
2:7-2 Percentage of high school graduates 25-29 years old who have completed 1 year of college or more, by race/ethnicity and sex: 1965-1990 ..... 127
2:7-3 Standard errors for estimated percentages in table 2:7-1 ..... 128
2:7-4 Standard errors for estimated percentages in table 2:7-2 ..... 129
2:7-5 Percentage of 25 - to 29 -year-olds who have completed 12 or more years of school, by race/ethnicity and sex: 1965-1990 ..... 130
2:7-6 Standard errors for estimated percentages in table 2:7-5 ..... 131
Indicator 2:8
2:8-1 Higher education graduates as a percent of all persons 22 years old, by field of study, sex, and country: Academic years beginning 1970, 1975, 1980 and 1987 ..... 132
SN 2:8 Sources of data ..... 134
Indicator 2:9
2:9-1 Minority field concentration ratio at the bachelor's degree level: Selected academic years ending 1977-1989 ..... 135
2:9-2 Percentage distribution of bachelor's degrees conferred, by race/ethnicity and field of study: Selected academic years ending 1977-1989 ..... 136
2:9-3 Number of bachelor's degrees conferred, by race/ethnicity and field of study: Selected academic years ending 1977-1989 ..... 138
Indicator 2:10
2:10-1 Female field concentration ratio at the bachelor's degree level, by field of study: Academic years ending 1971-1989 ..... 140
2:10-2 Percentage distribution of bachelor's degrees conferred, by $s \in x$ and field of study: Academic years ending 1971-1989 ..... 142
2:10-3 Percent of bachelor's degrees earned by women, by field of study: Academic years ending 1971-1989 ..... 147
Indicator 2:11
2:11-1 Percent change since 1977 in number of degrees earned and in number of high school and college graduates, by race: Selected years 1979-1989 ..... 149
2:11-2 Nuinber of degrees conferred, by race/ethnicity and degree level: Selected academic years ending 1977-1989 ..... 150
2:11-3 Number of degrees conferred, by sex, degree level, and race/ethnicity: Academic years ending 1977 and 1989 ..... 151
2:11-4 Standard errors for selected estimated percentages in table 2:11-1 ..... 152
Indicator ..... 2:12
2:12-1 Number of degrees conferred, by degree level and sex: Academic years ending 1971-1989 ..... 153
2:12-2 Percent of degrees earned by women, by degree level: Academic years ending 1971-1989 ..... 154
2:12-3 Percent change in number of degrees conferred since 1971, by degree ievel and sex: Academic years ending 1972-1989 ..... 155
Indicator ..... 2:13
2:13-1 Scores on the Graduate Record Examinations (GRE) and the ratio of the number of GRE test-takers to the number of baccalaureate degrees awarded: Academic years ending 1965-1989 ..... 156
2:13-2 Characteristics of Graquate Record Examination (GRE) test-takers: Academic years ending 1976-1989 ..... 157
2:13-3 Graduate Record Examination (GRE) scores for U.S. citizens only: Academic years ending 1973-1988 ..... 157
Indicator 2:14
2:14-1 Percent of baccalaureate degree recipients employed full time or enrolled in school 1 year after graduation by sex and race/ethnicity: Years of graduation 1977, 1980, 1984, and 1986 ..... 158
2:14-2 Standard errors for estimated percentages in text table for Indicator 2:14 and tablis. : if-1 ..... 159
Indicator ..... 2:15
2:15-1 Minority field concentration ratio at the master's degree level, by race/ethnicity and field of study: Selected academic years ending 1977-1989 ..... 160
2:15-2 Percentage distribution of master's degrees conferred, by race/ethnicity and field of study: Selected academic years ending 1977-1989 ..... 161
2:15-3 Number of master's degrees conferred, by race/ethnicity and field of study: Selected academic years ending 1977-1989 ..... 163
2:15-4 Minority field concentration ratio at the doctor's degree level, by race/ethnicity and field of study: Selected academic years ending 1977-1989 ..... 165
2:15-5 Percentage distribution of doctor's degrees conferred, by race/ethnicity and field of study: Selected academic years ending 1977-1989 ..... 166
2:15-6 Number of doctor's degrees conferred, by race/ethnicity and field of study: Selected academic years ending 1977-1989 ..... 168

## List of Supplemental Tables and Notes

## Page

## Indicator 2:16

2:16-1 Median total time-to-doctorate-degree among U.S. citizens and permanent U.S. residents, by field of study: 1970-1989 ..... 170
2:16-2 Median registered time-to-doctorate-degree among U.S. citizens and permanent U.S. residents, by field of study: 1970-1989 ..... 171
2:16-3 Percentage distribution of time-to-doctorate-degree among U.S. citizens and permanent U.S. residents, by field of study: 1989 ..... 172
Indicator 2:17
2:17-1 Median salary of college graduates as a percent of the median salary of all collega graduates who are working full time and not enrolled in college 1 year after graduation, by race/ethnicity, sex, and field of study: Years of graduation 1977, 1980, 1984, and 1986 ..... 173
2:17-2 Racial/ethnic, sex, and field of study distribution of baccalaureate degree recipients who are working full time and not enrolled in college 1 year after graduation: Years of graduation 1977, 1980, 1984, and 1986 ..... 174
2:17-3 Median salaries of college graduates who are working full time and not enrolled in college 1 year after graduation, by race/ethnicity, sex, and field of study: Years of graduation 1977, 1980, 1984, and 1986 ..... 175
2:17-4 Mean salaries of college graduates who are working full time and not enrolled in college 1 year after graduation, by race/ethnicity, sex, and field of study: Years of graduation 1977, 1980, 1984, and 1986 ..... 176
2:17-5 Standard errors for estimated median salaries in table 2:17-3 ..... 177
2:17-6 Standard errors for estimated mean salaries in table 2:17-4 ..... 178
Indicator 2:18
2:18-1 Labor force participation rate of 25 - to 34 -year-old males, by years of schooling completed: 1971-1990 ..... 179
2:18-2 Employment rate of 25 - to 34 -year-old males, by years of schooling completed: 1971-1990 ..... 180
2:18-3 Unemployment rate of 25 - to 34 -year-old males, by years of schooling completed: 1971-1990 ..... 181
2:18-4 Labor force participation rate ol 25- to 34 -year-old females, by years of schooling completed: 1971-1990 ..... 182
2:18-5 Employment rate of 25 - to 34 -year-old females, by years of schooling completed: 1971-1990 ..... 183
2:18-6 Unemployment rate of 25 - to 34 -year-old females, by years of schooling completed: 1971-1990 ..... 184
2:18-7 Standard errors for estimated percentages in table 2:18-1 ..... 185
z:18-8 Standard errors for estimated percentages in table 2:18-2 ..... 186
2.18-9 Standard errors for estimated percentages in table : :18-3 ..... 187
2:18-10 Standard errors for estimated percentages in table 2.18-4 ..... 188
2:18-11 Standard errors for estimated percentages in table 2:18-5 ..... 189
2:18-12 Standard errors for estimated percentages in table 2:18-6 ..... 190
SN 2:18 Labor force statistics ..... 191
Indicator 2:19
2:19-1 Ratio of median annual earnings of male wage and salary workers 25 to 34 years old with 9-11, 13-15, and 16 or more years of school to those with 12 years of school, by race/ethnicity: 1975-1989 ..... 192
2:19-2 Ratio of median annual earnings of female wage and salary workers 25 to 34 years old with $9-11,13-15$, and 16 or more years of school to those with 12 years of school, by race/ethnicity: 1975-1989 ..... 193
2:19-3 Median annual earnings of wage and salary workers 25 to 34 years old with 12 years of school, by sex and race/ethnicity: 1975-1989 (constant 1990 dollars) ..... 194
2:19-4 Standard errors for estimated ratios in table 2:19-1 ..... 195
2:19-5 Standard errors for estimated ratios in table 2:19-2 ..... 196
2:19-6 Standard errors for estimated modians in table 2:19-3 (constant 1990 dollars) ..... 197
Indicator 2:20
2:20-1 Number of degrees conferred at institutions of higher education, by level of degree: Academic years ending 1971-1989 ..... 198
2:20-2 Percent change in the number of degrees conferred at institutions of higher education since 1971, by level of degree: Academic years ending 1972-1989 ..... 199
2:20-3 Number and percent change since 1971 in number of high school and college graduates, by age: 1971-1989 ..... 200
2:20-4 Standard errors for estimated numbers and percentages in table 2:20-3 ..... 201
Indicator 2:21
2:21-1 Percent of graduate degrees earned by foreign students, by degree level and field of study: Selected academic years ending 1977-1989 ..... 202
2:21-2 Number of graduate degrees earned by foreign and Americarı students in 1989 and percent change between 1977 and 1989, by degree level and field of study ..... 203
2:21-3 Graduate degrees earned by foreign and American students, by degree level: Selected academic years ending 1977-1989 ..... 204
2:21-4 College graduates aged 25-34: Selected years ending 1977-1989 ..... 205
2:21-5 Percent of new foreign doctorate recipients who have definite post- graduation plans in the United States, by type of plan and major field: Academic years ending 1977-1989 ..... 206

## Indicator 2:30

2:30-1 Receipt of oarnings in addition to the basic faculty salary, meanbasic faculty salary, and mean total earned income among full-timefaculty in instifutions of higher education, by type of institutionand principal field of teaching: Fall 1987247
2:30-2 Mean basic faculty salary and total earned income of full-time faculty who were recipients and nonrecipients of earnings in addition to the basic faculty salary, by type of institution and principal field of teaching: Fall 1987 ..... 248
2:30-3 Standard errors for estimated percentages and means in text table for Indicator 2:30 and table 2:30-1 ..... 249
2:30-4 Standard errors for estimated means and percentages in table 2:30-2 ..... 250
2:30-5 Average full-time faculty salaries in constant 1989 dollars in institutions of higher education, by control and type of institution and academic rank: Selected academic years ending 1972-1988 ..... 251
SN 2:30 Definitions ..... 253

This volume contains 30 indicators. ${ }^{1}$ Collectively, they describe the condition of postsecondary education from a variety of perspectives. Each was selected to shed light on some important issue in postsecondary education for which current data are available.

This overview summarizes some major aspects of the potential entrants to postsecondary education (that is, high school graduates), reviews the structure of this volume, and examines evidence from the indicators about certain topics in postsecondary aducation (see Crosscutting Issues, page 4).

## Secondary students

The condition of postsecondary education cannot be judged in isolation from the condition of elementary and secondary education. After all, the preparation of the students who enter the colleges and universities of our Nation depends in large part on the quality of their elementary and secondary education. There are some encouraging signs. ${ }^{2}$ On the bright side:

- High school graduation rates among blacks have ri;ien dramatically over the past 25 years. !n 1965 only 50 percent of 25 - to 29 -ye r-old blacks were high school graduates. In 1990, 82 percent of this age group had graduated-less than 5 percentage points lower than whiles (supplemental table 2:7-5).
- Average college entrance examination scores (SAT) of high school students applying to college began rising in the early 1980s, after having fallen for many years. Thirty-nine percent of high school graduates took the SAT in 1990, up from 33 percent in 1980, and their average total score was 900 , up 10 points from 1980 (Indicator 1:9 and supplemertal table 1:9-3).

[^2]- High school students are taking more academic courses, especially in mathematics and science. Members of the high school class of 1987 took 2.97 years of mathematics and 2.59 years of science, in each case up .40 years from the high school class of 1982 ( 1990 Condition of Education, Volume 1, Indicator 1:13). Among 1987 graduates, 47 percent had taken Algebra II, up from 35 percent in 1982; 45 percent had taken Chemistry, up from 31 percent in 1982 (1991 Indicator 1:14). A similar improvement was shown in foreign languages.

But not all the news is positive:

- High school graduation rates among Hispanics 25-29 years old are low-around 60 percent-and did not improve over the decade of the 1980s (supplemental table $2: 7-5)^{3}$
- Those without a high school diploma face an economy and society that is increasingly complex, technological, and information-driven, and yet, only 86 percent of 25 - to 29 -year-olds have completed high school. With less than a high school education, nearly 15 percent will be at a substantial disadvantage. Among those who completed high school by ages 25 to 29, a substantial fraction did so through alternate routes such as the GED.

High school graduates make up the "pool" of candidates for postsecondary education." Among whites, the percentage finishing high school has been stable since 1976. However, among blacks, the percentage finishing high school has increased substantially and the population of blacks has grown somewhat faster than that of whites. Therefore, blacks make up an increasing proportion of the "pool" of candidates for postsecondary education. Given recent improvements in SAT scores and in NAEP scores for 17-year-old blacks, these cohorts appear better prepared for college level studies than those in the recent past.

[^3]
## Structure of The Condition of Postsecondary Education

A quick tour of the volume may help the reader make the best use of it. The core of the volume is the 30 posisecondary indicators. Each indicator is presented on two pages. On the first page are three components: (1) a short paragraph providing the justification for the indicator, (2) bullets summarizing the main results, and (3) a table with the data. On the second page, one or more charts graphically illustrate some of the results. The 30 indicators are organized into 3 parts and 10 sections. The three parts are (I) Student Progression and Outcomes, (II) Context, and (III) Resources.

Student Progression and Outcomes. In the first part, five sections describe student progression through postsecondary education-the education pipeline. These five sections are designed to approximate the progression of students from first entry into college to entry into the labor market. Section A, Access and Participation, includes measures of the proportions of high school graduates who started college immediately, and those who delayed doing so. It also includes two indicators of access from the perspective of college cost and family income. Section B, Persistence, inciudes a measure of continuous attendance from one year to the next among college students. Persistent attendance is a prerequisite for progress, and progress is a prerequisite for completion. For those who complete college, a measure of the total time between high school andege graduation is included.

Section C, Educational Attainment and Curriculum, includes measures of college completion in recent cohorts compared to the past and to other countries. This section also describes the changing distribution of majors chosen by college graduates. Section D, Continuation to Advanced Levels, is directed to graduate education. It includes a measure of the general learned abilities of students applying to graduate school, a measure of the proportion of recent college graduates enrolling in graduate school, a measure of the fields chosen by graduate students and a measure of the time students take to complete a doctor's degree. Section E , Economic Outcomes, the final section of the five describing the pipeline of higher education, includes two economic outcomes: employment and earnings. The indicators demonstrate the relationship of these outcomes to the amount of postsecondary education an individual has invested in and to their chosen major field.

Context. In the second part on context, the two sections, G, Size and Growth, and H , Student Ch : racteristics, provide measures of the changing character of higher education both in terms of its institutions (2-v. 4-year, public v. private) and its students (race/ethnicity, age, and so forth). These characteristics only partially
describe the changing context for learning and instruction in higher education. The reierence group for these indicators is all students enroiled in higher education.

Resources. In the third part on Resources, the final two sections, I, Fiscal Characteristics, and J, Faculty, provide measures related to the resources, both human and financial, used in higher education.

Comparisons. Some indicators inform about progress of the student or adult population, whereas others inform about the educational system as a whole. Almost all the indicators in sections $A$ through $E$ have clear population reference groups. These include: (1) families with children approaching college age (Indicator 2:3), (2) high school graduates (indicators $2: 1$ and 2:7, (3) those enrolled in college (Indicätors 2:2, 2:4, and 2:5), and (4) college graduates (Indicators 2:6, 2:9, 2:14, and $2: 15$, for example). The last section in Part I, Section F, Output and Productivity of Colleges and Universities, includes measures of two outputs of postsecondary education: degrees and research. lindicators based on degrees conferred by colleges and universities (such as Indicator 2:20) usually do not have a clear population reference group. In these cases, the primary reference is the number of degrees awarded in an earlier year. This is also the reference for Indicators 2:11 and 2:12 that present information on degrees awarded by race/ethnicity and sex. Without a clear population reference group these measures provide only indirect evidence of the flow through the pipeline, and are more appropriately viewed as measures of the output of the higher education system.

## Crosscutting Issues

The remainder of this overview discusses several key issues which cut across indicators and sections of the report: (1) access, persistence, and completion rates, (2) minorities in higher education, (3) women in higher education, (4) mathematics, science, and engineering, (5) the cost of higher education, and (6) the financial returns to a college education.

## Access, Persistence, and Completion Rates

Has the college completion rate changed over the 1970s and 1980s? The answer to this question is complicated by many factors, which have spurred some debate. One way to simplify the discussion is to divide the larger question into component questions.

Of high school graduates, what proportion starts college in the year they graduate? In October of 1989, 58 percent of the males who graduated from high scinoo! in 1089 started college; arnong women it was 62 percent (supplemental table 2:1-2). The proportion of men starting coliege in the October following high school graduation fell during the first half of the seventies: the rate was 60 percent in 1968 and 50 percent in 1975. Recently it has rebounded. Among women It was generally below 50 percent before 1980 and above 50 percent since 1980.

Of those who start college, what proportion finishes within 5 years of starting? The proportion has fallen. Among members of the high school class of 1972 who started college in the fall of 1972, either at 2 -year or 4 -year institutions, either full-time or part-ime, 33 percent had graduated with a baccalaureate degree within 4.5 years of starting. Among members of the high school class of 1980, the comparable rate was 22 percent. ${ }^{5}$ Turning the question around, among college graduates in 1986, 66 percent took 5 or fe'ver years from high school graduation, down from 71 percant ameng 1977 graduates (Indicator 2:6).

What proportion of high school graduates finishes college? The trends are different for men and women. In 1990, among men 25-29;'ears old wio had finished high school, 28 percent had also finished 4 or more years of college (Indicator 2:7). This was 22 percent in 1965 and increased to a peak of 32 percent in 1976. The rate then declined gradually. In 1990, 26 percent of women high school graduates 25-29 years old had finished 4 or more years of college. Between 1965 and 1977, this rate increased from 14 to 25 percent and has changed little since 1977. An alternative approach to measuring the college completion rate of an age group, such as 25 - to 29 -year-olds, is to measure the college completion rate of a high school graduating class a given number of years after graduation. Among members of the high school graduating class of 1972, 25 percent had completed a baccalaureate degree by the end of 1978, 6.5 years after graduation. Among members of the class of 1980, 20 percent had a baccalaureate degree by the end of $1986 .{ }^{6}$

In summary, there was a decline between 1976 and 198 i in college completion rates among male high sclool graduates and little discernable trend vetween 1981 and 1990. Among women it has not declined. Young peopin are taking longer to tinish college, making it more difficult to compare attainment rates over time. To the extent that "on-time" completion of college is important for bringing the skills and knowledge

[^4]acquired in college to the economy and society as quickly as possible, the trend appears to be in a negative direction. But to the extent that the Nation values eventual completion of a college degree, the figures seen can be interpreted more optimistically-young people appear to be persisting to completion in the face of higher costs and more part-time attendance.

## Minorities in Higher Education

Blacks have made great strides in education. Much of the increased economic prosperity of blacks relative to whites from 1940 to 1980 has been attributed to the increase in the amount and quality of their education. ${ }^{7}$ The gains made by blacks in education in the 1980s, however, were uneven. Blacks continued to make gains in elementary and secondary education. For example, high school completion rates among blacks continued to increase between 1090 and 1989-the fraction of blacks 16-24 years old not enrolled in high school and who had not finished high school fell from 19 to 14 percent between 1980 and 1989. ${ }^{8}$

In recent years, blacks have regained some of what they lost in pnstsecondary education between 1977 and 1983. In 19 ${ }^{\circ} 7,48$ percent of blacks graduating from high school enrolled in college that fall (Indicator 2:1). That rate fell to 39 percent in 1933 and rebounded to 50 percent by $1988 .{ }^{9}$ While the 1977 rate for blacks was not significantly below the rate for whites, by 1983 this difference had increased to 16 percentage points. In 1988, the difference in this measure of immediate entry to college was 9 percentage points. Black high school graduates are more likely than whites to delay starting postsecondary education. Among high school graduates in 1982 who had started college before 1986, 30 percent of blacks in contrast to 20 percent of whites delayed their start.

Differences between whites and blacks in the fields they shose to study for their baccalaureate degrees have largely disappeared. In 1977, blacks were less likely to major in the natural sciences and engineering and more likely to choose the social

[^5]sciences and education (Indicator 2:9) than whites. In 1989, the field distribution for blacks was largely similar to that for whites. Blacks were less likely than whites to choose education as a major and more likely than whites to choose business or other technical/professional fields.

Role models are important for young people who are developing their expectations and zspirations for their future roles as adults. Teachers are often looked to as role models and mentors. Thus, as fewer blacks choose education as a career, the already scarce supply of black teachers will be exacerbated and fewer children will have black teachers as role models and mentors.

Blacks are less likely than whites to continue on to graduate school immediately after receiving their baccalaureate degrees (supplemental table 2:14-1). This may reflect the greater concentration of blacks than whites in education at the graduate level (Indicator 2:15). Doctoral students in education take more total time between completion of the baccalaureate and doctoral degrees than students in other fields (Indicator 2:16), much of which may be due to a period of working in the field prior to starting their graduate education. The number of master's and doctor's degrees awarded to blacks in 1989 was down 33 and 15 percent, respectively, from 1977 levels (Indicator 2:11). However, most of this downturn can be attributed to blacks leaving education as a field (Indicator 2:15). So, the downturn in advanced degrees awarded to blacks may be as much due to changes in the fields blacks chose to study as it is to other factors.

Among Hispanics 25-29 years old, the high school graduation rate in 1990 was 59 percent, far below the rate for blacks or whites (supplemental table 2:7-5). Despite this lower high school graduation rate, measures of Hispanic high school graduates' participation in postsecondary education generally are similar to measures for backs. For example, on average between 1985 and 1980, 48 percent of Hispanics enrolled in college following high school graduation in contrast to 46 percent of blacks and 57 percent of whites (supplemental table 2:1-2). Once enrolled as undergraduates, an estimated 82 percent of Hispanic students re-enroll the following year, about the same as for black (ridfrgraauates (supplemental table 2:5-2). Among those continuing, 77 percent of Hispanics had progressed to a higher grade lovel in contrast to 87 percent of biacks. In 1990, among Hispanics 25-29 years old who had finished high school, 14 percent had finished 4 or more years of college, similar to the 16 percent rate among blacks, but far below the 28 percent of whites (Indicator 2:7). In 1989, the distribution of major fields of the baccalaureate degrees awarded to Hispanics were generally similar to that of whites, but there were some differences. Hispanics were more likely to major in the humanities and social sciences and less likely to major in education than whites (Indicator 2:9). The number of first-professional and master's degrees awarded to Hispanics was larger
in 1989 than in 1987. It is not clear, however, whether the number has kept pace with the growth in the Hispanic population and in the number of Hispanic college students (suppiemental table 2:11-2).

## Women in Higher Education

raditionally, women have been as likely as men to finish high schnol, but less likely go on to college. However, by the late 1980s, women had closed much of the S. in higher education. For example, since 1975 the rates at which men and N( ien have enrolled in college following high school graduation have been very sim ar (Indicator 2:1). In 1975, of high school graduates $\mathbf{2 5 - 2 9}$ years old, 23 percent of women and 30 perceric of men had finished 4 years of college. In 1990, the gap was 2 percentage points- 26 percent of women and 28 percent of men had finished 4 years of college. Differences in higher education attainment between men and women are very small (Indicator 2:7).

An area where substantial differences remain is field of study (Indicator 2:10). In 1989, men were five times as likely as women to receive a baccalaureate degree in computer sciences or engineering; on the other hand, women were three times as likely as men to recei e a baccalaureate degree in education. The choice of fields may account for part of the gap between men and women in starting salaries for recent college graduates (supplemental table 2:17-1), because education majors average the lowest starting salaries and engineering and computer science majors, the highest.

The labor force paricicipation rates of women rose steadily throughout the 1970s and 1980s for those with a high school education or better. By 1990, of women 25-34 years old who completed colloge, the percentage employed was about 10 percentage points lower than for men- 83 versus 93 percent, in con rast to a 27 point gap in 1975 (Indicator 2:18). Women college graduates shared in the growth in earnings of all college graduates in the 1980s. Although women college graduates earn less on average than men college graduates, the earnings premium women enjoy over their counterparts with only a high school education is greater than that for men (Indicator 2:19).

## Mathematics, Science, and Engineering

There are at least two reasons why we as a Nation are particularly concerned with mathematics, science, and engineering education. First, since World War II the United States has been a leader in producing new science and engineering knowledge and in translating this knowledge into new technologies that increase
worker productivity and generally improve the quality of life. Secend, with the inevitable increase in the sophistication of the technologies used in the workplace (particularly computers and information retrieval), it is increasingly important for workers to be technologically literate. Jobs that used to require a narrow range of skills now often demand an increasingly wide range of skills, particularly problemsolving skills. The importance of science and mathematics has been underscored by the President and the Governors who have set a goal that "by the year 2000, U.S. students will be first in the world in science and mathematics achievement."

High school preparation to study science and mathematics at the collegiate level is very important. A 1981 international comparison of the achievement of 17 -year-olds concluded that not only were U.S. students less likely to take advanced mathematics and science courses but also the achievement of those who did take the advanced courses compared poorly to their counterparts in other countries. ${ }^{10}$ It is possible that U.S. students have improved their performance since this study was conducted. High school graduates in 1987 took more mathematics and science courses than did graduates in 1982. Not only did graduates in 1987 take more credits in mathematics and science, but they were less likely to take remedial or below-grade-level math, and more likely to take algebra II, geometry, chemistry, and other advanced mathematics and science courses (Volume 1, Indicator 1:14).

In the United States, the general rate of participation and completion of higher education for both sexes is much greater than in the other major industrialized economies of the world. However, in the U.S., the number of baccalaureate degrees in engineering as a percent of 22 -year-olds is one-half the corresponding rate in Japan and on!y slightly higher than the rate in Germany. On the other hand, the number of baccalaureate degrees in the natural sciences as a percent of 22-yearolds is twice the corresponding rates in both Japan and Germany (Indicator 2:8).

The nurnber of baccalaureate degrees awarded in engineering iricreased during both the 1970s and 1980s. In computer and information sciences, the number awarded more than tripled between 1980 and 1988, an indication of the responsiveness of undergraduates to the demand created by the explosion of computer use in the U.S. during the 1980s. ${ }^{11}$ The number of graduate degrees awarded in computer science

[^6]also increased, but not at the same rate as baccalaureate degrees. Between 1977 and 1989, graduate engineering degrees awarded to American students increased by 40 percent and 36 percent at the master's and doctor's levels, respectively (supplemental table 2:21-2). Engineering has become more oriented toward science (theoretical) and less toward design (applied) and the tools are becoming more sophisticated, requiring more engineers with graduate education.

At the same time, the share of engineering doctorates awarded to non-U.S. citizens by U.S. universities increased from 33 percent in 1977 to 48 percent in 1989 (Indicator 2:21). During this period, non-U.S. citizens earned 68 percent of the increased number of engineering doctoral degrees awarded. This is an indication that U.S. graduate programs in engineering are among the best in the world, however, much of the riew talent these programs create may not stay in the U.S. (supplemental table 2:21-5).

The natural sciences have not experienced the same growth as engineering and computer sciences. In 1980, about 80,000 baccalaureate degrees were awarded in both the natural sciences and in engineering and computer sciences. In 1988, the number awarded in the natural sciences declined somewhat whereas the number in engineering and computer sciences increased substantially. Within the natural sciences, the number of degrees in both the life and physical sciences decreased, whereas the number of degrees in mathematics increased after having experienced a major decline during the 1970s. ${ }^{12}$

Although the study of the natural sciences accounts for a relatively small share of all baccalaureate degrees, they may attract some of the most talented college students. Undergraduates majoring in the natural sciences are among the most likely to complete the degree in 4 years (supplemental table 2:6-1). These graduates are also the most likely to continue to graduate school-in 1986 the rate was 33 percent (Indicator 2:14). However, in 1989, the number of master's and doctor's degrees awarded to American students in the life sciences, physical sciences, and mathematics was lower than the number awarded in 1977 (supplemental table 2:21-2).

## The Cost of Higher Education

Colleges and universities increasingly depend on tuition and fees for revenue. Between 1980 and 1987, at public institutions the share of revenue generated by tuition and fees increased from 15 to 19 percent; at private institutions, the share

[^7]increased from 52 to 56 percent (supplemental table 2:26-2). During this period, at public universities tuition charges per full-time-equivalent (FTE) student had increased 27 percent (in constant dollars); at other public 4-year universities, 23 percent; and at private universities 34 percent (supplemental table 2:27-3).

As tuition rose between 1980 and 1987, expenditures per FTE student for instruction also rose faster than inflation. ${ }^{13}$ At public universities, expenditures per FTE for instruction increased 9 percent (in constant dollars). At other public 4 -year colleges, expenditures per FTE student for instruction increased 5 percent (supplemental table 2:27-1). At private universities, expenditures per FTE for instruction increased 26 percent (supplemental table 2:27-2).

Higher education institutions aiso faced increasing costs of the goods and services that they purchased during the 1980s. For example, in 1988 average facuity salaries were between 13 and 15 percent higher at public institutions than they had been in 1981 (in constant dollars), and at private institutions, between 15 and 17 percent higher (supplemental table 2:30-5). ${ }^{14}$

During the 1980s, students and their families faced increasing costs of college education. Whereas increases in median family income stayed only slightly ahead of inflation, charges for tuition, room, and board rose 27 percent at public institutions and 46 percent at private institutions in constant dollars (Indicator 2:3). However, most students receive financial aid to offset some of the cost of college attendance (Indicator 2:28). Among students ircin families with incomes less ihan $\$ 30,000$ who were attending public 4 -year colleges during the 1986-87 academic year, between one-half and two-thirds of the total cost of attendance was met by financial aid; among those attending private 4 -year institutions, between 60 and 70 percent of the total cost was met by financial aid (Indicator 2:4).

The average charge for tuition and fees is the price paid by a student who does not receive financial aid. However, in 1986-87 most students received financial aid (Indicator 2:28). A considerable portion of financial aid comes from the college as opposed to an external scurce such as the federal or state government. Colleges and universities use their revenues to provide financial aid, in effect reducing the price to students who cannot afford the full price or who the college wants to attract for other reasons. At public universities, between 1981 and 1987, expenditures per

[^8]FTE student for scholarships and fellowships increased 20 percent (in constant dollars); at other public 4 -year colleges, only 2 percent (supplemental table 2:27-1). At public 4 -year institutions, 17 percent of undergraduates receive institutional aid (supplemental table 2:28-1). At private universities, expenditures per FTE student for scholarships and fellowships increased 42 percent. At private institutions, 51 percent of undergraduates received institutional aid during 1986-87.

In addition, outside sources of finaricial aid help pay the increasing tuition. At public 4 -year institutions, 42 percent received federal financial aid during the 1986-87 academic year (supplemental table 2:28-1). At private 4 -year institutions, 55 percent received federal financial aid.

## Returns to a College Educalion

The early 1970s were characterized by a fall in the earnings of college graduates relative to those of high school graduates. This led some analysts to suggest Americans were over-educated. ${ }^{15}$ However, in the 1980s this trend sharply reversed. The relative earnings of college graduates, both men and women, increased remarkably. In 1975, white male college graduates 25-34 years old earned only 18 percent more than those with only a high school education, but in 1989, they earned 45 percent more. Although women earn less than men, they receive a higher economic return to a college education. In 1989, white women with 4 or more years of college earned 89 percent more than white women with only 12 years of school, up from 74 percent in 1975. Amoing black women the premiums were even larger (Indicator 2:19). These large earnings premiums for college graduates encourage more young people to enroll in college, pay the sometimes high price of tuition, and complete a baccalaureate degree.

## Conclusion

In the preceding discussion we have covered only some of the issues treated by the 30 indicators in this volume. The reader is encouraged to read the overview to each subsection for discussion of other issues, to peruse the indicators of interest, and to refer to the supplementary tables for additional details.

[^9]3.3

# Indicators of Postsecondary Education 

## I. Student Progression and Outcomes

## A. Access and Participation

Wide access to postsecondary education for individuals from all parts of our society has been a national objective for many years. Actual participation is one indicator of the accessibility of postsecondary education to today's young people. The traditional route to higher education is to enroll in the fall following high school graduation. The proportion of high school graduates that enroll in college the Cctober following graduation measures this phenomenon (Indicator 2:1). However, some young people take time out from school to earn money, to travel, and to provide themselves with time to decide what they want to study and to develop the motivation to do so. The proportion of 1982 high school graduates starting postsecondary education within 4.5 years of graduation but not enrolling in the fall following graduation measures this phenomerion (Indicator 2:2). Participation is a useful but imperfect indicator of accessibiity. For instance, with no change in accessibility but with a decline in the rewards of postsecondary education, participation may fall. Another indicator of accessibility is the monetary cost of a year of college education, which is approximated by the cost of tuition, room, and board. This price provides an indicator of financial hindrances to college enrollment, which complements the participation indicators (Indicator 2:3). However, there are many financial aid programs designed to defray the cost of college attendance for those who cannot afford the full cost. Thus, another indicator of accessibility is the net cost, the total cost of attendance less financial aid, compared to "expected family contribution,"* an estimate of what the family shnuld reasonably be able to aiford to contribute toward the education of their children (Indicator 2:4).

The proportion of high school graduates in 1989 continuing to college in the fall was 60 percent (supplemental table 2:1-2). This rate has not been exceeded in the 23 years it has been calculated. In both 1988 and 1989, there was some evidence that the proportion of females continuing to college may be slightly larger than the proportion of males (supplemental table 2:1-2). The proportion of males eni. "ๆ in college immediately after high school graduation rose during the 1980s after falling during the first half of the 1970s and remaining stable during the last half of the 1970s. On the other hand, the rate at which female high school graduates enroll in college increased during most of the last two decades. Since the middle of the 1970s there has been generally little difference in the college-going propensities of men and women (Indicator 2:1).

The contrast between blacks and whites is different. Up through 1977 or 1978, the gap in college-going rates (Indicator 2:1) between blacks and whites was declining. The 1976-78 average for blacks was not significantly lower than for whites. However, between 1978 and 1982, the gap widened as white college-going rates

[^10]increased and black rates decreased. Since 1982 black college-going rates have begun to increase again, but in 1988 the gap between blacks and whites remained sizable. The college-going rates of recent Hispanic high school graduates have fluctuated widely, but on average since 1986 have been similar to that o. blacks. Blacks and Hispanics have been more likely than whites to delay starting postsecondary artucation (Indicator 2:2). Thus, some of the difference in the rates of immediate continuation to college are reduced by considering those who delay starting postsecondary education. Those who delay are also more likely to enroll in a 2-year college or a vocational school.

Among high school graduates who enroll in college in the fall following graduation, blacks and whites make a similar pattern of choices between 4 -year, 2 -year, and other institutional types. Hispanics, however, are much more likely to choose a 2-year college (Indicator 2:2).

College tuition at both public and private colleges fell after 1972 (in constant 1990 dollars) and for the 1980-81 academic year reached it lowest level since 1967 for private institutions and since before 1964 for public institutions (supplemental table 2:3-2). !n 1980-81, average tuition, room, and board at public colleges was $\$ 3,744$; at private colleges it was $\$ 8,630$ (Indicator 2:3). Since 1981, the cost of attending college has risen steadily. At public colleges it rose to $\$ 4,739$ for the 1989-90 academic year; at private colleges it rose to $\$ 12,640$. This represents a growth of 27 and 46 percent (faster than the Consumer Price Index) over the period for public and private colleges, respectively. During the same period, the median income of families with all children 6 to 17 years old (the closest approximation available to families with children approaching college age) grew far less-3 percent. The income of families at the 25th percentile of the income distribution fell 1 percent. The net result is that without any scholarship, grant, or loan aid, the average annual cost for tuition, room, and board at public colleges increased from 10 to 12 percent of the median income of families with children 6 to 17; and from 17 to 22 percent of the income of families at the 25th percentile of the income distribution. At private colleges, a family with the median income now would pay 33 percent of their annual income for a year of tuition, room, and board; a family at the 25 th percentile would pay 59 percent (supplemental table 2:3-1).

The actual cost of college attendance is partially defrayed by financial aid. Among dependent undergraduates at public 4 -year colleges (enrolled full-time and for the full-year) during the 1986-87 academic year from farilies with income less than $\$ 17,000$ (in 1986 dollars) almost two-thirds of the total cost of attendance was met by financial aid (Indicator 2:4). However, for more than one-half of these families the remaining expenses (the net cost) still exceeded the "expected family contribution," an estimated amrount the family should reasonably be expected to contribute toward the education of their dependent child.

## A. Access and Participation

## Indicator 2:1 Immediate transition from high school to college

Most college students enroll in college immediately after finishing high school. So the percent of recent high school graduates enrolled in college in the October following graduation is a leading indicator of the total proportion who will eventually enroll. The percent enrolling is a measure of the accessibility of postsecondary education to high school graduates.

- More than half, 58.4 percent, of 1988 high school graduates were enrolled in college in October of 1988.
- The proportion of men going to college directly from high school declined during the early 1970s, but began to Increase in the 1980s, and by the late 1980 s was nearly as high as in the late 1960 s.
- The gap between men and women in the proportion going to college directly from high school disappeared by the mid-1970s.
. The gap between whites and blacks narrowed to its minimum in the mid-1970s, and since has varied, but in 1988 was 10 percentage points.

Percent of high school graduates enrolling in college in the October following graduation, by sex, race/ethnicity, and type of college: 1968-1988 (selected 3-year averages)

| Year ${ }^{1}$ | Total | Male |  |  | Female |  |  | Race/ethnicity |  |  |

## A. Access and Participation

## Indicator 2:2 Timing of entry to college

The proportion of high school graduates enrolling in postsecondary education is a measure of its accessibility. However, there are important differences in the types of institutions they may attend and some graduates may choose to delay starting postisecondary education. The type of institution chosen might reflect differences in cost, location, required high school preparation, or orientation toward work. Delay could indicate a choice to travel or work before deciding to return to the education system. Later entrance may also indicate dissatification with labor market opportunities for those with no education beyond high school.

- Among high school graduates in 1982 continuing to college before 1986, whites were more likely than blacks, and blacks were more likely than Hispanics to enroll in a 4year college. Hispanics were more likely than either blacks or whites to enroll in a 2year college.
- Both blacks and Hispanics were more likely than whites to delay starting postsecondary education. For example, among 1982 high school graduates starting postsecondary education before 1986, 30 percent of blacks had delayed their enrollment in contrast to 18 percent of whites.
- There ware few differences in the tendency to delay starting postsecondary education between high school graduates in 1972, 1980, and 1982 who had continued to postsecondary education within about 4.5 years of graduation (supplemental tables 2:2-1, 2:2-2, and 2:2-3).

Date of first enrollment in postsecondary education among 1982 high school graduates who enrolled befort 1986, by race/ethnicity and type of institution

| Race/ethnicity and type of institution | Date of first enrollmerit in postsocondary education |  |  |  |  |

## A. Access and Participation

## Indicator 2:3 College costs and fainily income

The ability of a family to afford to send its children to college depends on many factors, including tuition levels, availability of financial aid, family income, and family size. Tuition, room, and board are a measure of the gross price of college. Deducting financial aid amounts produces the net price. The average cost for fuition, room, and board as a percent of family income is an indicator of the financial accessibility of a college education.

- College tuition levels fell after 1972, reaching a low point for the 1980-81 academic year; since then, college costs have risen rapidly (In constant 1990 dollars).
- At private colleges, tuition has grown more rapldiy than at public colleges-46 percent versus 27 percent between 1980 and 1989. Median family income has not kept pace; it grew only 3 percent over the same period. The Income of families at the 25th percentile fell 1 percent over the period, while income of families at the 75th percentile grew 7 percent.

| Year | Undergraduate tuition, room, and board |  | Percentiles of family income distribution among families with children 6-17 years old* |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | P. iblic | Private | 20th | 25th | Median | 75th |
|  | (Constant 1990 dollars) |  |  |  |  |  |
| 1975 | \$4,026 | \$8,851 | \$20,334 | \$23,815 | \$38,201 | \$53,818 |
| 1976 | 4,087 | 8,924 | 20,894 | 24,334 | 39,705 | 55,502 |
| 1977 | 4,050 | 8,920 | 20,578 | 24,114 | 39,892 | 56,127 |
| 1978 | 3,976 | 9,000 | 20,822 | 24,335 | 40,272 | 55,725 |
| 1979 | 3,877 | 8,796 | 20,509 | 23,966 | 39,771 | 57,088 |
| 1980 | 3,744 | 8.630 | 18,535 | 21,862 | 37,212 | 54,319 |
| 1981 | 3,808 | 8,818 | 17,410 | 20,778 | 36,167 | 52,759 |
| 1982 | 3,967 | 9,322 | 16,464 | 20,017 | 35,330 | 52,400 |
| 1983 | 4,119 | 9,800 | 16,309 | 19,802 | 35,161 | 53,515 |
| 1984 | 4,264 | 10,262 | 16,923 | 20,462 | 35,816 | 54,559 |
| 1985 | 4,314 | 10,735 | 17,668 | 20,994 | 37,154 | 55,442 |
| 1986 | 4,513 | 11,477 | 17,273 | 20,886 | 37,472 | 57,101 |
| 1987 | 4,635 | 12,030 | 17,459 | 20,986 | 38,372 | 58,391 |
| 1988 | 4,697 | 12,296 | 17,806 | 21,334 | 38,305 | 58,363 |
| 1989 | 4,739 | 12,640 | 17,913 | 21,556 | 38,312 | 58,001 |

*These families may have children 18 or over; however, there is at least one child between 6 and 17 years old and none under 6.
NOTE: Tuition data are for academic years beginning 1975-1989 and family income data are for calendar years 1975-1989. The calendar year Consumer Price Index was used to calculate constant dollar figures.

## A. Access and Participation

## Indicator 2:4 Net cost of college attendance

One factor affecting a student's access to postsecondary education is the net cost of attendance in relation to the family's ability to pay. The net cost of attendance is tuition and fees, room and board, books, transportation, and other miscellaneous expenses less financial aid. The family's ability to pay is measured by the expected family contribution (EFC). If the net cost of attendance is less than the EFC, then the student has access to postsecondary education. If the student has access to institutions in several cost ranges, then the student has choices among several types of postsecondary institutions.

- At institutions of the same type and control, a larger percentage of the total cost of college attendance is met by financial aid among students from families with lower income.
- Among students with similar family income, the percentage of the total cost met by financial aid increases with the average total cost of attendance at the institution.
- Of students from families with income less than $\$ 30,000$ attending public 4-year colleges, only about one-half had net costs that were covered by the expected family contribution.

Total cost of college attendance, average percent of total cost met by aid, and percent of students with net cost covered by expected family contribution for full-time full-year dependent undergraduates, by type and control of institution and family income: 1987

| Type and control and family income | Total cost (average) | Average percent of total cost met by |  | Percent of students with |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | Net cost | Adjusted net cost |

## B. Persistence

Not all students who enter postsecondary institutions intend to complete the requirements for a 4 -year baccalaureate degree. Many enter 2 -year and less-than2 -year institutions with the intention of completing programs of shorter duration. Others start their postsecondary education with the intention of earning a degree, but for a variety of reasons are not able to or must delay doing so.

Research has shown that persistent attendance is strongly associated with the likelihood of finishing. ${ }^{1}$ A break in continuous attendance, that is, dropping out or stopping out, is most likely to occur during the first 2 years in college. During the last half of the 1980s, about 81 percent of freshmen were still enrolled 1 year later (Indicator 2:5). ${ }^{2}$ Among sophomores, the percentage enrolled again 1 year later was somewhat lower, reflecting the end of 2 -year programs. Then it rises to 88 percent in the junior year. Continuous attendance rates are higher now than they were during the last half of the 1970s.

However, these rates are lower for Hispanics and blacks. The difference between whites and blacks was larger during the last half of the 1980s than it had been during the last half of the 1970s.

Only 43 percent of seniors in October of 1988 were enrolled again in October of 1989 indicating that most did not continue to graduate school. Among those enrolled again in October 1989, one-third were still seniors, indicating more than 4 years were required to complete their undergraduate education (supplemental table 2:5-2).

If college students are completing fewer courses each year, then it will take then: longer to complete their programs. ${ }^{3}$ If they delay starting their schooling, then they will be older when they do complete. The time between high school and college graduation captures both of these influences (Indicator 2:6). In 1986, less than half-46 percent-of baccalaureate degree recipients had finished in 4 years or less since high school graduation; in 1977, 54 percent finished in 4 years or less. Fewer

[^12]blacks and Hispanics than whites finish in 4 years, and more blacks and Hispanics than whites take more than 6 years.

## B. Persistence

## Indicator 2:5 Persistence rates

Persistent attendance and full-time attendance are stronaly associated with completion of a 4-year degree. Those who attend part-time or stop out (i.e., have periods of nonattendance) are less likely to complete a degree. A measure of persistent attendance is the proportion of students enrolled in 2 consecutive years.

- Between 1985 and 1989, black and Hispanic college students on average were less likely to be enrolled for 2 consecutive years than white college students.
- For whites, continuous attendance rates have shown a generally increasing trend (though not consistently so) since the mid-1970s.
- Continuous attendance after the $\mathbf{2 n d}$ year of college is generally lower than after the first year, reflecting completion of 2 -year programs. Continuous attendance after the third year is higher than after the first year.
- Forty-three percent of college seniors in 1988 were enrolled again in 1989, and 35 percent of those enrolted again indicated they were still seniors (supplemental table 2:5-2).

Average percent of college students 16-24 years old enrolled the previous October who are enrolled again the following October, by race/ethnicity and level: 1974-1989

| Year | Race/ethnicity |  |  | College level previous October |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## B. Persistence

## Indicator 2:6 Time between high school and college graduation

A large majority of college graduates enrolled in college immediately after high school graduation, and the vast majority of baccalaureate degree programs can be completed in 4 years by a student taking a standard, full-time course load two semesters or three quarters each year. Students take longer to graduate if they delay starting college, stopout to work, travel, raise a family, or take reduced course loads, to name a few reasons. Sonie students choose to take longer in order to mix work and travel with study. Others do so because of financial necessity or family responsibilities. Taking a longer time to finish college means there is less time to enjoy the benefits of being a college graduate such as a higher paying job.

- In 1986, less than one-half of those graduating from college-46 percent-finished within 4 years of high school graduation; 27 percent took more than 6 years.
- Between 1977 and 1986, the percentage finishing in 4 years from high school graduation decreased for males as well as females, for whites as well as blacks, and for natural science majors as well as education majors (supplemental table 2:6-1).
- Whites graduating from college in 1986 were more likely to have finished within 4 years of high school graduation than blacks, Hispanics, or Asians. In contrast to 26 percent of whites, 38 and 37 percent of blacks and Hispanics, respectively, graduated from college more than 6 years after high school graduation.

Time between high school graduation and award of the baccalaureate degree, by race/ethnicity and sex: Years of college graduation 1977 and 1986

Chart 2:6 Time between high school graduation and award of the baccalaureate degree, by race/ethnicity: Years of college graduation 1977 and 1986

Indicators presented earlier provided measures of immediate and delayed transition to college atter high school and rates of continuous attendance. Those indicators provided measures of entry into the higher education pipeline and movement through it. This section presents two measures of completion of a 4 -year degree, the result of sustained participation and a major milestone. These measures depend on three factors: (1) the proportion finishing high school, (2) the proportion of high school graduates who start college and (3) the proportion of college starters who go on to complete college. The first measure is the college completion rate for high school graduates as a whole, whether or not they ever attended college; this measure depends on factors (2) and (3). The second measure is the annual number of craduates expressed as a percentage of persons 22 years old; this depends on all three factors mentioned above.

The higher education pipeline takes many branches as coliege students choose the field they want to study. These choices have important implications for what these students can pursue at the graduate level, earnings, and employment opportunities in the labor market. The concentration ratio, presented in two of the indicators, allows comparison of the choices made by blacks and Hispanics to those of whites and of the choices made by women to those of men.

In the past, women have been as likely as men to finish high school but less likely to finish college. However, the college attainment rates for men and women have recently converged. In 1990, the proportion of white male high school graduates 25-29 years old who had finished 4 years of college had declined 4 percentage points from its peak in the mid-1970s (from 33 percent in 1976 to 29 percent in 1990), whereas the rate for white women had risen 4 percentage points in the same time frame (from 24 to 28 percent) (Indicator 2:7).

Men in the United States are less likely to graduate from college than men in Japan, but they are more likely to graduate than men in West Germany, England, France, or Canada. However, in engineering or science fields, the advantage of U.S. men is smailer or reversed because far fewer American college students choose such majors than do students in other countries. For example, West German men are as likely as U.S. men to graduate in engineering fields, and French men are more likely to graduate in the science fields (Indicator 2:8).

As noted above, the college completion rate of women is now generally the same as it is for men. Women in the United States are twice as likely to finish college as women in Japan or West Germany. Among larger countries, only Canadian women are as likely to graduate from college. However, the undergraduate major fields women choose remain markedly different from those men choose (Indicator 2:10). Women are more than three times as likely as men to chose education as a major.

On the other hand, they are one-fifth as likely as men to choose computer science or engineering. However, using a broad definition of science that includes health (which women are very likely to choose) and computer sciences, American women are more likely than American men or women from other large courtries to graduate from coilege in a science field (Indicator 2:8).

The proportion of black high school graduates 25-29 years old who had finished college increased from 12. percent during the last half of the 1960s to 16 percent during the last half of the 1970s, and it declined slightly then remained about level through most of the 1980s at about 14.5 percent. However, throughout the last two decades, high school completion rates of blacks r.se markedly-from 50.3 percent in 1965 to 81.7 percent in 1990 (supplemental table 2:7-5). Thus, the proportion of all blacks 25-29 with 4 or more years of college increased from 7.0 percent in 1965 to 13.4 percent in 1990. An alternative measure of the progress of blacks in higher education is based on the number of degrees awarded to blacks of all ages in a given year. The number of baccalaureate degrees awarded to blacks in 1989 was 11 percent lower for black men and 7 percent higher for black women than it was in 1977, whereas the number of high school graduates in both groups grew.

The major fields of the undergraduate degrees earned by blacks are changing relative to those of whites (Indicator 2:9). In 1977, blacks were 42 percent more likely than whites to major in education. They were 49 percent less likely to major in engineering or computer science, and 35 percent less likely to major in the natural sciences. By 1989 this pattern changed dramatically. In that year, blacks were 29 percent les: likely to major in education, and were only 4 and 9 percent less likely to major in engineering/computer sciences and natural sciences, respectively. In 1989 blacks were more likely than whites to major in business and technical/professional fields and in the social and behavioral sciences. The likelihood of Hispanics completing undergraduate degrees in engineering or natural sciences also rose. In engineering and computer science it rose from 10 percent less likely to 9 percent more likely than whites between 1977 and 1989. In the natural sciences it rose from 18 percent less likely to equal!y likely. Minority students are now studying engineering and science at the undergraduate level at considerably higher levels than in the recent past. On the other hand, the decreasing likelihood that blacks and Hispanics choose to major in education may exacerbate the shortage of black and Hispanic teachers. The increasing representation of blacks and Hispanics in computer science, engineering, business, and other technical/professional fields is likely to lead to an increase in their labor market earnings.

## C. Educational Attainment and Curriculum

## Indicator 2:7 Educational attainment ai ages 25 to 29

Completing 4 years of college is an important educational accomplishment that will yield many benefits to those who achieve it. It represents the end-result of both starting college and persistent enrollment. Some students siop out, others drop out, but the vast majority of those who will ever complete 4 years of college do so by their late twenties.

- In 199\%, 28 percent of white high school graduates 25-29 years old had completed 4 or more years of college. In contrast, only 16 percent of black and 14 percent of Hispanic high school graduates had done so.
- The college completion rate among male high school graduates reached a maximum of 32 percent in 1976. By 1981 it had fallen to 27 percent and since then it has not changed very much.
- In 1990, the college completion rates for men and women were similar. Between 1965 and 1976, however, the percentage of female high school graduates finishing college was at least 6 percentage points below the percentage for their male counterparts.

Percentage of high school graduates $\mathbf{2 5 - 2 9}$ years old who have completed 4 years of college or more, by race/ethnicity and sex: Selected years 1965-1990

| Year | All races |  |  | White |  |  | Black |  |  | Hispanic* |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Both | Male | Female | Both | Male | Female | Both | Male | Female | Both | Male | Female |

## C. Educational Attainment and Curriculum

## Indicator 2:8 International comparisons of higher education attainment

The percentage of an age group completing undergraduate degrees in other highly industrialized countries provides a means of evaluating the accessibility of and participation in higher education in the United States. Furthermore, comparing the percentage completing degrees in scientific and engineering fields with other advanced countries measures the levels of knowledge of the U.S. population in technical fields. A highly skilled labor force is important for the United States to maintain a position as a world leader in technical fields.

- A higher percentage of males completed higher education in Japan than did males in the U.S. during the 1980s.
- The percentage of males graduating in the sciences was higher in the U.S. than it was in Japan. The percentage of males graduating in engineering in the U.S. was less than one-half that of Japan and the same as in West Germany.
- The percentage of women graciuating in the science fields (Including health sciences) was much higher in the U.S. than in the other countries. In the U.S., a larger fraction of women complete higher education in science fields than do men.
- The percentage of women graduating in science fleids (Including health sciences) increased from what it was in the early 1970s in the U.S. and Japan.

Higher education graduates as a percent of all persons 22 years old, by field of study, sex, and country

| Sex and <br> country | Academic year <br> beginning | All <br> fields | Engineering | Total <br> science | Natural <br> sciences |
| :--- | ---: | :---: | ---: | ---: | ---: |

[^13]
## C. Educational Attainment and Curriculum

## Indicator 2:9 Baccalaureate field of study, by race/ethnicity

The fields pursued by college students affect the career opportunities open to them. The minority field concentration ratio* shows how much the fields studied by minority students differ from those of white students. A ratio above 1 indicates that minority students are more likely than white students to major in a field, and a ratio below 1 indicates that they are less likely to major in a field. Changes in the size of the ratio over time show whether minority/majority differences in field of study are narrowing or widening.

- The field of study distributions of both blacks and Hispanics became increasingly similar to the distribution of whites during the 1977-87 decads. Since 1987, however, the minority-majority gap in fleld preferences has widened a little ;'supplemental table 2:9-2).
- Black-white differences in the selection of science and engineering majors generally narrowed between 1977 and 1989. In the natural sciences, the narrowing of differences was largely due to declining interest among white students, not to increasing interest among black students. In engineering, it occurred because sfudent preferences for the fleld increased at a faster pace among blacks then among whites (supplemental sables 2:9-2 and 3).
- The black concentration ratio in education changed dramatically between 1977 and 1989, from 1.42 to $\mathbf{. 7 1}$. In 1977, blark students were more likely than white students to major in education, but by 1989, the reverse was true.

Minority field concentration ratio at the bachelor's degree level, by field of study: Selected academic years ending 1977-1989

| Field of study | Black concentration ratio |  |  |  | Hispanic concentration ratio |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1977 | 1981 | 1985 | 1989 | 1977 | 1981 | 1985 | 1989 |
| Humanities | 0.69 | 0.74 | 0.83 | 0.80 | 1.17 | 1.11 | 1.09 | 1.10 |

## C. Educational Attainment and Curriculum

## Indicator 2:10 Baccalaureate field of study, by sex

The female field concentratien ratio* shows how much the fields studied by women differ from those studied by men. Ratios above 1 indicate that women are more likely than men to major in a field, and ratios below 1 indicate that they are less likely to major in a field. Changes in the ratio show whether field of study differences between men and women are narrowing or widening. They thus point to peissible future changes in the occupations and earnings potential of wornen compared with men.

- Women and men differ greatly in their major fields of study. Women are more likely than men to major in education, the humanities, and other technical/professional fields and less likely to major in the natural sciences, the computer sciences and engineering, and business.
- Sex differences narrowed somewhat between 1971 and 1989 in most fields. Despite this, however, substantial differences remain. In 1989, social and behavioral sciences was the only field with a concentration ratio at or near parity (1.00).
- The proportion of women majoring in education dropped substantially between 1971 and 1989, from 36 to 14 percent. Nevertheless, women are still over three times more likely than men to major in the fieid. In 1989, more than three-fourths of the bachelor's degrees conferred in education were awarded to women.

Female field concentration ratio at the bachelor's degree level, by field of study: Selected academic years ending 1971-1989

| Field of study | 1971 | 1974 | 1977 | 1980 | 1983 | 1986 | 1989 |

## C. Educational Attainment and Curriculum

## Indicator 2:11 Degrees conferred, by race/ethnicity

The ability of our colleges and universities to attract and retain minority students is important to the Nation's success in achieving its goal of equal opportunity. Changes in the number of degrees earned by minorities and by whites measure higher education's progress toward this goal.

- The number of bachelor's degrees earned by whites was higher in 1989 than it had been in 1981, but the number earned by blacks was lower.
- Among blacks, the period from 1977 to 1985 was one of substantial growth in the number of high school graduates aged 20-24. This growth was not accompanied by comparable increases in the number of bachelor's degree recipients. Between 1987 and 1989, however, the number of bachelor's degrees earned by blacks rose even though the number of black high school graduates fell.
- Despite substantial growth in the number of black and white college graduates aged 25-34 between 1977 and 1989, the number of advanced degrees fell for both races. The drop in degrees was greater for blacks than whites.

Percent change since 1977 in number of high school and college graduates and in number of degrees earned, by race and degree level: Selected years 1981-1989

| Degrees and | White |  |  |  |  | Black |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: | :---: |
| graduates | 1981 | 1985 | 1989 |  | 1981 | 1985 | 1989 |  |
| Bachelor's degrees | 0.3 | 2.6 | 6.6 |  | 3.7 | -1.8 | -0.9 |  |
| Advanced degrees | -5.3 | -11.3 | -6.5 | -14.0 | -27.0 | -26.5 |  |  |

## C. Educational Attainment and Curriculum

## Indicator 2:12 Degrees conferred, by sex

Historically, women have earned fewer degrees than men, especially at the graduate level. An important issue is whether and how much the differences between .lien and women have narrowed at the different degree levels. Also of interest is whether women have actually become overrepresented at any level.

- The percent of degrees earned by women increased substantially between 1971 and 1989 at all degree levels. Growth was most rapid during the 1970 but continued in the 1980s at a slower pace.
- The growth in women's share of degrees was most dramatic at the doctor's and firstprofessional levels. Their share of doctor's degrees increased from 14 to 37 percent and their share of first-professional degrees from 6 to 36 percent between 1971 and 1989.
- Most of the growth in women's share of degrees occurred because the number earned by women increased much more rapidly than the number earned by men. In the case of doctor's degrees, however, women's share partly increased because the number earned by men declined.
- In 1989, women earned more than one-half of the associate's, bachelor's, and master's degrees and over one-third of the doctor's and first-professional degrees.

## D. Continuation to Advanced Levels

The final stage of formal education is graduate school. That is the place where our young people become teachers, scholars, scientists, physicians, and lawyers. In addition to the direct contribution these professionals make to the U.S. economy and society, they serve as the role models for future generations of school children. In addition, new faculty for colleges and universities come from the Nation's graduate schools.

Just as the SAT and ACT exams provide measures of the general learned abilities of prospective undergraduates, the Graduate Record Examinations (GRE) provide measures of the general learned abilities of prospective graduate students. The number of GRE test-takers as a fraction of baccalaureate degrees avrarded declined between 1971 and 1982, but since has been rising (Indicator 2:13). The average total GRE test score reached its low in 1979 but rose 51 points by 1989. Among U.S. citizens, the average total GRE test score rose 42 points between 1978 and 1988 (supplemental table 2:13-3). The quantitative scores fell less and began rising earlier than the verbal scores. These trends in GRE scores suggest that the quality of graduate students may have been increasing during most of the 1980s.

Not all students who eventually earn graduate degrees continue their studies immediately after getting a baccalaureate degree (for example, graduate schools of management often encourage prospective students to gain some work experience before pursuing an MBA degree). However, the proportion who do continue immediately is a leading indicator of the ultimate number who ever will. Among college graduates in 1986, 11 percent were enrolled in graduate school (and not working full time) about 1 year later (Indicator 2:14). College graduates in 1986 were more likely to take a full-time job and less likely to enroll in graduate school than college graduates 9 years earlier. The proportion going on to graduate school varies widely by undergraduate major. Among those with unde.graduate degrees in businass, only 4 percent went on to graduate school in 1986; among those with undergraduate degrens in the natural sciences, 33 percent went on to graduate school.

The number $\boldsymbol{\partial}$ doctoral degrees awarded to U.S. citizens was 4.6 percent lower in 1989 than in 1977 (Indicator 2:21). However, among women the number increased 53 percent, and among men it decreased 25 percent (derived from figu:es in supplemental table 2:11-3). Among men, it increased only for Asian men. Among women, it increased for all racial/ethnic groups. By 1989, white women, Hispanics, and Asians earned larger shares of doctora' degrees than they had in 1977. The number of first-professional degrees awarded was 10 percent higher in 1989 than in 1977. The total number of master's degrees awarded fell slightly-a large increase in master's degrees in business and computer science was balanced by a large fall in master's degrees in education. The decline in master's degrees
awarded was concentrated among whites and blacks. The number awarded to Hispanics and Asians rose. In general, during the 1977-1989 period, the number of advanced degrees conferred did not keep pace with the number of baccalaureate degrees awarded or increases in the population.

A substantial percentage of doctoral degrees are awarded in education. In 1989, 22 percent of doctoral degrees awarded to whites, 42 percent of those awarded to blacks, and 26 percent of those awarded to Hispanics were in education (supplemental table 2:15-5). However, in each case, the percentage was lower than it had been in 1977. In addition, the median total time between the award of the baccalaureate degree and the doctoral degree in education is higher than in other fields and increased from 13.3 years in 1980 to 17.7 years in 1989 (Indicator 2:16). Women are more likely than men to choose education for their doctoral field of study- 30 v. 13 percent in 1989.* At the undergraduate level, 14 percent of women and 5 percent of men choose education as their major (supplemental table 2:10-2).

Blacks and Hispanics are less likely than whites to earn a doctorate in the natural sciences. In 1989, 22 percent of doctorates awarded to whites, 12 percent of thuse to blacks, and 17 percent of those to Hispanics were in the natural sciences. In each case, the percentage was slightly higher than it had been in 1977. The median total time beiween the baccalaureate degree and the doctoral degree in the natural sciences is much shorter than it is for other fields, especially education, but increased from 6.1 years in 1980 to 7.5 years in 1990. In 1989, 17 percent of doctoral degrees awarded to women and 27 percent of doctoral degrees awarded to men were in the natural sciences.

[^17]
## D. Continuation to Advanced Levels

## Indicator 2:13 Graduate Record Examination (GRE) scores

The Graduate Record Examination (GRE) is a measure of the general learned abilities of prospective graduate students. It is used to predict performance in graduate scinool. No good measure of the amount of learning acquired during college exists. The GRE, although taken by less than a third of college graduates, is the best broad-based measure of general learned abilities that exists for prospective graduate students. However, the reader should be aware of the limitations of average GRE scores which include: (1) the proportion of college graduates taking the exam changes over time, (2) an increasing proportion of foreign students are taking the exam, and (3) some students take the exam more than once.

- The average total score on the GRE fell 70 points between 1965 and 1979. Since then it has increased 51 points.
- The average quantitative score on the GRE has risen 52 points since 1975, and is now higher than at any time since the mid-1960s. The verbal score has risen 15 points since 1982, but is still well below the levels of the mid-1960s.
- Non-U.S. cilizens do better on the quantitative component and more poorly on the verbal component of the GRE than U.S. citizens. Also, the percentage of test-takers who are not U.S. citizens has been increasing.

Graduate Record Exam scores and number of test-takers: Academic years ending 1965-1989 (selected years)

| Year | Number | GRE test-takers |  | GRE scores |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Percent <br> of BAs | Percent U.S. citizens |  |  |  |
|  |  |  |  | Total | Verbal | Quantitative |
| 1965 | 93,792 | 18.7 | -- | 1,063 | 530 | 533 |
| 1967 | 151,134 | 27.0 | - | 1,047 | 519 | 528 |

## D. Continuation to Advanced Levels

## Indicator 2:14 Continuation to graduate school

Postgraduate education is where the most advanced levels of knowledge are acquired. Scientific advances depend in large part on a continuing supply of highly educated young scientists. The renewal of faculty in colleges and universities depends on new generations of PhDs and other advanccú degree recipients. Law, medicine, and business are other fields that depend on students pursuing postgraduate education. in most fields, the percent of baccalaureate degree recipients immediately enrolling in graduate school, as opposed to taking full-time jobs, is a measure of the future supply of adve.nced talent in those fields.

- The proportion of baccalaureate degree recipients going on to graduate school immediately following graduation declined from 17.3 percent for 1977 graduates to 11.4 percent for 1986 graduates.
- The deciline in the rate of continuation to graduate school held for females as well as males and for minorities as well as for whites (supplementary table 2:14-1).
- The rate of continuation to graduate school for graduates who majored as undergraduates in the humanities, social science, and natural science fields was much higher than it was for those who majored in computer science/engineering or technical/professional fields, such as education and business.

Percent of baccalaureate degree recipients employed full-time or enrolled 1 year after graduation: Years of graduation 1977, 1980, 1984, and 1986

| Major field of study | Employed full-time |  |  |  | Enrolled* |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1977 | 1980 | 1984 | 1986 | 1977 | 1980 | 1984 | 1986 |

## D. Continuation to Advanced Levels

## Indicator 2:15 Graduate field of study, by race

The fields pursued by college students affect the career opportunities open to them. The minority field concentration ratio* shows how much the fields studied by minority students differ from those of white students. A ratio above 1 indicates that minority students are more likely than white students to major in a field, and a ratio below 1 indicates that they are less likely to maior in a field. Changes in the size of the ratio over time show whether minority/majority differences in field of study are narrowing or widening.

- Black and white graduate students differ in their fields of study, especiallי at the doctor's degree level. Their differences narrowed somewhat between 1977 and 1989, but gaps remaln.
- Black graduats students are much more likely than white graduate students to specialize in education. This is particulariy true at the doctorate level where, in 1989, 42 percent of black compared with 22 percent of white students earned degrees in the fleld.
- Black graduate students are much less likely than white graduate students to earn degrees in sclence and engineering. Between 1977 and 1989, these differences narrowed at the master's but not at the doctor's degree level.
- The fleld distributions of Hispanics and whites are more allke than those of blacks and whites. This is true at both the master's and doctor's degree levels.

Black field concentration ratio and percent of degrees, by race: Selected years

| Field of study | Black field concentration ratio: 1977 and 1989 |  |  |  | Percent of degrees, by race: 1989 |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Master's degrees |  | Doctor's degrees |  | Master's degrees |  | Doctor's degrees |  |
|  | 1977 | 1989 | 1977 | 1989 | White | Black | White | Black |
| Humanities and social/behavioral sciences | 0.69 | 0.69 | 0.76 | 0.95 | 15.7 | 10.9 | 33.5 | 31.8 |
| Natural and computer sciences and engineering | 0.35 | 0.53 | 0.36 | 0.39 | 12.2 | 6.5 | 31.2 | 12.1 |
| Education | 1.49 | 1.28 | 2.22 | 1.92 | 29.3 | 37.5 | 21.9 | 42.0 |
| Business and other technical professional | 0.75 | 1.05 | 0.72 | 1.04 | 42.8 | 45.1 | 13.5 | 14.0 |

## D. Continuation to Advanced Levels

## Indicator 2:16 Time to the doctorate degree, by field

Trends in the number of years doctoral students take to complete their degrees suggest changes in the time needed to produce doctorate-level personnel. These trends may provide clues to other important changes as well, such as in students' financial resources and in part-time study. Total time-to-degree (TTD) measures the number of years between completion of the baccalaureate and doctorate degrees and thus includes nonenrolled as well as enrolled time. Rэgistered time-to-degree (RTD), however, only measures the number of years enrolled, full-time or part-time, in graduate school.

- Between 1970 and 1989, total and registered time-to-degree increased in all fields, with absolute growth in total time exceeding that in registered time.
- Total time-to-degree grew the most in eciucation, whereas the greatest growth in registered time occurred in the humanities.
- Time-to-degree varies by field of study. Students in the natural sciences and in the computer sciences and engineering take less time than average to complete their degrees, whereas education students generally take longer than average.
- Field differences in time-to-degree are smaller for registered than for total time.

Median total and registered time to the doctorate degree among U.S. citizens and permanent U.S. residents, by field of study: 1970, 1980, 1989

| Field of study | Median total time-to-degree |  |  | Median registered time-to-degree |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1970 | 1980 | 1989 | 1970 | 1980 | 1989 |
| Total | 7.9 | 9.4 | 11.0 | 5.6 | 6.4 | 7.2 |
| Humanities | 9.2 | 10.7 | 12.6 | 6.0 | 7.6 | 8.4 |
| Social and behavioral sciences | 7.6 | 8.8 | 10.6 | 5.6 | 6.6 | 7.7 |
| Natural sciences | 6.1 | 6.8 | 7.5 | 5.3 | 5.8 | 6.3 |
| Computer sciences and engineering | 6.9 | 7.7 | 8.1 | 5.3 | 5.8 | 6.2 |
| Education | 12.7 | 13.3 | 17.7 | 6.3 | 7.0 | 8.3 |
| Other technical/protessionai | 8.5 | 9.8 | 12.8 | 5.4 | 6.1 | 7.3 |

## E. Economic Outcomes

Postsecondary education is an investment in human skills. The investment involves both a cost and a return. The cost includes tuition, books, and fees, but also earnings given up by not working or by working part time while in e:llege. The returns come in many forms. Some are monetary, others are not. Some are related to the labor market, others are not. Among the returns related "t "ie labor market are better employment opportunities, jobs that are less sensitive? 10 ;ent ral economic conditions, better opportunities to participate in employer-provided training, better working conditions, and higher earnings. Other returns not related to the labor market include greater interest and participation in civic affairs, better health and longer life, and reduced criminal behavior.

The costs and returns to investing in postsecondary education change over time, ${ }^{\text {' }}$ which affects the incentive for individuals to participate. The purpose of the measures presented in this section is to provide indicators of changes in the rewards of investing in postsecondary education.

These indicators suggest some general conclusions. First, labor market opportunities for male college graduates were strong and did not vary downward during recession years. Consistently, over 90 percent of college graduate men were employed. On the other hand, the labor market opportunities of male high school graduates were more variable and seem to have drifted downward just slightly during the 1971-1990 period. The ratio of average annual earnings of college graduates to those of high school graduates provides an indication of the incentive to attend college. For white males 25-34 years old, the college premium increased from about 14 percent during the last half of the 1970s to about 43 percent in the last half of the 1980s. For black males the college premium was even larger. The earnings premium of college graduates in recent years (1985-1989) is at its highest levels of the 1975-1989 period.

Second, labor market opportunities for women, both high school graduates and those who attend college, grew enormously between 1971 and 1990. The proportion of females 25-34 years old with 4 or more years of college who were employed increased from 57 to 83 percent over the period. The proportion of high school graduate wonien employed grew from 43 to 68 percent over the same period. The earnings advantage enjoyed by college graduate women over their high school

[^21]graduate counterparts was even larger than it was for men. ${ }^{2}$ For white females 25-34 years old, the advantage was 89 percent in 1989. For black women it was 105 percent. These were the highest earnings premiums enjoyed by college women during the 1975-1989 period.

While there is a great earnings premium for graduating from college, there are great differences among college graduates who chose different fields of study. Computer science and engineering majors earn the highest starting salaries-36 percent above the average across all fields among 1986 graduates. Education majors earn the lowest starting salaries-18 percent below the average. College students appear to be sensitive to these differences. The percentage majoring in engineering and computer science has increased from 9 to 17 percent betwe 3n 1977 and 1986. The percentage majoring in education has fallen from 18 to 9 percent over the same period. ${ }^{3}$

[^22]
## E. Economic Outcomes

## Indicator 2:17 Starting salaries of college graduates

One of the factors college students use to choose a major is the pay they anticipate receiving for their work. Employers adjust what the; pay new college graduates based on how valuable their skills will be to the firm and on the difficulty they nave finding qualified individuals to fill the jobs. Differences across fields in starting salaries of college graduates provide indications. of the fields which are more valuable to employers and the fields in which there are too few graduates compared to the requirements of employers. Changes over time in these diffe ences can provide insights into the responsiveness of the education system and young people to chen'jes in conditions in the labor market.

- Engineering and computer science majors recelve the highest starting salaries followed by those majoring in business. Education majors receive among the lowest starting salaries.
- Batween 1980 and 1986, the premium sarned by engineering and computer science and business majors tell. In 1980 natural sclence majors recelved starting salarles equal to those of all college graduates; in 1986 their starting salaries were $\mathbf{7}$ percent below the average.
- Between 1980 and 1986, differences in median starting salaries narrowed-for 6 of the 7 major field categories, the median starting salary in 1986 was closer to the median for all college graduates than it had been in 1980.

Differences in median starting salaries of college graduates, by major field of study: Years of graduation 1977, 1980, 1984, and 1986
(Percent above or below the median starting salary for all college graduates)

|  | Year of graduation |  |  |  |
| :--- | ---: | ---: | ---: | ---: |
|  | 1977 | 1980 | 1984 | 1986 |

## E. Economic Outcomes

## Indicator 2:18 Employment of young adults

The percentage of a population group with jobs is influenced by a variety of factors. Some influence the willingness of employers to offer jobs to individuals with different levels of education at the going wage rate, and others influence the willingness of these individuals to take jobs at the going wage rate. The higher the proportion emploved, the better are their labor market opportunities relative to other things they could do, and vice versa.

- Employment rates are generally higher for those with more education.
- During economic recessions (such as 1982-83), employment rates among males with 12 years of schooling or less fell more than they did for college graduates. The same was true, but to a lesser extent, for females with no college education.
- Among women 25-34 years old, the employment rate of those with 12 or more years of schooling increased by about 25 percentage points between 1971 and 1990 versus 9 percentage points for those with 9-11 years of schooling.
Employment rate of 25- to 34-year-olds, by sex and years of schooling completed: 1971-1990

| Year | Male |  |  |  | Female |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 9-11 years of school | 12 years of school | 1-3 years of college | 4 or more years of college | 9-11 years of school | 12 years of school | 1-3 years of college | 4 or more years of college |
|  | Percent |  |  |  |  |  |  |  |

## E. Economic Outcomes

## Indicator 2:19 Annual earnings of young adults

Wages and salaries are influenced by many factors. Among these are the employer's perception of the productivity of employees with different levels of education and the availability of workers with different levels of education. Wages are also affected by economic conditions in the industries that typicaliy employ workers with different levels of education. Annual earnings are influenced by the number of weeks worked in a year and the usual hours worked each week. The ratio of annual earnings of college graduates to high school graduates is affected by all these factors; it is a measure of the earnings advantage of finishing college.

- In recent years (1985-89), the earnings advantage of college graduates $25-34$ years old over their counterparts with only 4 years of high school was larger than it was in the last half of the 1970s; it was larger for blacks than for whites; and it was larger for females than for males.
- During the last half of the $\mathbf{1 9 8 0}$ s, the earnings advantage of college graduates was, on average, 43 and 54 percent for white and black males, respectively. For white and black females, the advantage was even larger-75 and 92 percent, respectively.

Ratio of median aimual earnings of wage and salary workers 25 to 34 years old with 9-11 and $\mathbf{1 6}$ or more years of school to those with $\mathbf{1 2}$ years of school, by sex and race/ethnicity: 1975-1989

| Year | 9-11 years of school |  |  |  | 16 or more years of school |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Male |  | Female |  | Male |  | Female |  |
|  | White | Black | White | Black | White | Black | White | Black |
| 1975 | 0.81 | 0.67 | 0.65 | 0.60 | 1.18 | 1.29 | 1.74 | 1.70 |
| 1976 | 0.79 | 0.80 | 0.61 | 0.58 | 1.14 | 1.41 | 1.61 | 1.58 |
| 1977 | 0.79 | 0.77 | 0.62 | 0.63 | 1.15 | 1.42 | 1.53 | 1.61 |
| 1978 | 0.78 | 0.74 | 0.55 | 0.48 | 1.13 | 1.48 | 1.58 | 1.38 |
| 1979 | 0.79 | 0.78 | 0.71 | 0.66 | 1.11 | 1.31 | 1.56 | 1.53 |
| 1980 | 0.80 | 0.75 | 0.63 | 0.73 | 1.18 | 1.33 | 1.54 | 1.65 |
| 1981 | 0.78 | 0.68 | 0.62 | 0.56 | 1.29 | 1.34 | 1.55 | 1.58 |
| 1982 | 0.72 | 0.77 | 0.66 | 0.69 | 1.33 | 1.55 | 1.61 | 1.65 |
| 1983 | 0.75 | 0.65 | 0.66 | 0.65 | 1.34 | 1.50 | 1.69 | 1.59 |
| 1984 | 0.64 | 0.61 | 0.58 | 0.52 | 1.32 | 1.53 | 1.59 | 1.68 |
| 1985 | 0.73 | 0.70 | 0.62 | 0.66 | 1.45 | 1.77 | 1.64 | 1.76 |
| 1986 | 0.72 | 0.85 | 0.62 | 0.78 | 1.43 | 1.64 | 1.74 | 1.92 |
| 1987 | 0.72 | 0.86 | 0.70 | 0.56 | 1.38 | 1.47 | 1.72 | 1.93 |
| 1988 | 0.70 | 0.56 | 0.53 | 0.62 | 1.41 | 1.37 | 1.78 | 1.93 |
| 1989 | 0.73 | 0.60 | 0.66 | 0.50 | 1.45 | 1.42 | 1.89 | 2.05 |

NOTE: The ratio is most usefully compared to 1.0. For example, the ratio of 1.45 in 1989 for white males with 16 or more years of school means that they earned 45 percent more than white males with 12 years of school. The ratio of 0.60 in 1989 for black males with 9-11 years of school means that they earned 40 percent less than black males with 12 years of school.

[^23]
## Chart 2:19 Ratio of median annual earnings of wage and salary workers 25 to 34 years old with 9-11 and 16 or more years of school to those with 12 years of school, by sex and race/ethnicity: 1975-1989 <br> Male

Female
Ratio

NOTE: One on the scale represents earnings equal to those with 12 years of school; 2 represents double their earnings; .5 represents half their earnings. The scale on the graph makes the distance between 1 and 2 , or doubling, the same as bremeen 1 and .5 , or halving.

## F. Output and Productivity of Colleges and Universities

The postsecondary education system is the primary source of advanced knowledge and skills for the economy and socioty. A degree awarded to an individual is an indication that the higher education system has helped make more knowledge and skill available in the economy and society. As such, the numbers of degrees conferred by level and field provide measures of the quantity and type of knowledge being protuced by the systeri, as embodied in its graduates. The output of the higher edication system depends on the inputs to the system as well as the productivity of the system. Undergraduate education depends on the number and quality of high school graduates; graduate education depends on the number and quality of coliege graduates. Not all of the produced knowledge stays in the United States. The higher education system trains and awards degrees to many foreign students; higher education today is an export industry. Research and development is an important activity in many higher education institutions and is another avenue through which higher education contributes new knowledge to the economy and $\checkmark$ ciety. About 10 percent of national R\&D expenditures were made in higher education (doctoral degree granting) institutions in 1989 (Indicator 2:22). The federal government's share of the funding for these $18 \& \mathrm{D}$ expenditures has declined during the 1980s, while industry's share has increased.

Despite the fact that the number of high school graduates 20 to 24 years old has declined every year since 1983, the number of baccalaureate degrees awarded has grown each year (supplemental table 2:20-1). ${ }^{1}$ The distribution of major fields, however, has been changing. ${ }^{2}$ In general, the share of degrees in the humanities and sciences has fallen, and the share in professional fields has risen. The exception was education, whose share declined significantly. Between 1971 and 1988, the share of degrees in business and other technical/professional fields almost doubled, increasing from 24 percent in 1971 to 42 percent in 1988. On the other hand, the share of degrees in education fell fromi 22 percent to 9 percent. Most recently, there has been a turnabout. The share of degrees in the hurnanities and social sciences increased slightly between 1984 and 1988, and the share in computer sciences and engineering decreased slightly. The share of degrees in the natural sciences continued to fall.

In contrast to the slow growth of baccalaureate degrees, the number of associate degrees increased 81 percent between 1971 and 1983, but fell 5 percent between 1983 and 1989.

[^24]At the graduate level, master's degrees numerically are very important. In 1988, almost 310,000 master's degrees were awarded in contrast to 71,000 firstprofessional degrees and 36,000 doctoral degrees (supplemental table 2:20-1). Two-thirds of master's degrees are awarded in education, business, and other technical/professional fields. ${ }^{3}$ In 1971 education accounted for 39 percent and business and other technical/professional fields for 24 percent of master's degrees. In 1988, that distribution essentially revarsed-education accounted for 26 percent and business and other technical/protessional fields for 42 percent of master's degrees.

The number of doctoral degrees changed very little during the last two decades when compared with changes in master's or first-professional degrees. The low for the 1971-to-1989 period was 32,107 in 1971; the high was 35,759 in 1989, an 11.4 percent increase. In fact, between 1985 and 1989 there has been an upward trend in doctoral degrees awarded. However, the share of these degrees awarded to U.S. citizens fell from 88.7 percent in 1977 to 78.5 percent in 1989.

The share of doctoral degrees in the natural sciences fell from 28.8 percent in 1971 to 22.5 percent in 1976. In 1988 it stood at 23.4 percent. ${ }^{4}$ The precipitous decline between 1971 and 1976 has not continued. However, the share of those natural science doctoral degrees awarded to U.S. citizens has fallen. The U.S. citizen share stood at 86.3 percent in 1977, but by 1989 fell to 74.4 percent (supplemental table 2:21-1). The result was a 5.8 percent decline in the number of doctoral degrees in the natural sciences awarded to American students (supplemental table 2:21-2). In 1989 foreign students earned 47.1 percent of all doctoral degrees in computer science and engineering.

In contrast to the slow growth of doctoral degrees, the number of first-professional degrees, which includes law and medicine, grew enormously between 1971 and 1985-almost doubling. However, between 1985 and 1989 the number fell somewhat.

[^25]
## F. Output and Productivity of Colleges and Universities

Indicator 2:20 Degrees conferred, by level
Trends in the number of degrees conferred, by level, provide clues to changes in the productivity of the Nation's higher education system, the allocation of rescurces within the system, and the level of trained individuals within the society. Viewed in relation to the number oi high school and college graduates,* the data show whether degrees have lagged behind or exceeded growth in the eligible population.

- The number of bachelor's degrees grew throughout the 1980 s even though the number of high school graduates aged 20-24 decilned every year after 1983.
- The number of associate degrees grew rapidiy during the 1970 and early 1980 s but decliried in 5 of the 6 years between 1983 and 1989. The drop in associate degrees during the latter period was smaller than the decline in high school graduates aged 20-24 (5 versus 12 percent).
- During the 1971-89 period, the increase in the college graduate population aged 25-34 greatly exceeded the growth in the number of advanced degrees.
- Following years of negative or liftle growth, the number of doctor's degrees rose 9 percent between 1985 and 1989, reaching lis highest-ever level in 1989. Despite the recent growth, doctor's degrees made up a smaller percentage of the 25- to 34-year old coilege graduate population in 1989 than they had in 1971.

Percent change since 1971 in number of degrees and of high school and college graduates

|  | 1975 | 1980 | 1985 | 1989 |
| :--- | ---: | ---: | ---: | ---: |
| Associate degrees | 42.6 | 58.7 | 80.0 | 72.3 |
| Bachelor's degrees | 9.9 | 10.7 | 16.6 | 21.2 |
| Master's degrees | 26.9 | 29.3 | 24.2 | 34.4 |
| Doctor's degrees | 6.2 | 1.6 | 2.6 | 1.4 |
| First-professional degrees | 47.4 | 84.8 | 97.8 | 86.5 |
| High school graduates, aged 20-24 |  |  |  |  |
| College graduates, aged 25-34 | 14.5 | 28.3 | 26.6 | 14.9 |

87

## F. Output and Productivity of Colleges and Universities

## Indicator 2:21 Graduate degrees earned by foreign students

Growth in the foreign student population can affect enrollment levels and, in turn, influence the amount and allocation of material, personnel, and financial resources. It may also signal potential problems for U.S. economic competitiveness, depending on changes in the number of Americans receiving degrees in critical fields and on whether the foreign students stay in this country to work after completing their studies.

- Between 1977 and 1989, foreign students earned an Increasing proportion of the graduate degrees awarded by American colleges and universities. In 1989, they earned 11 percent of the mastor's degrees and 22 percent of the doctor's degrees.
- The proportion of doctor's degrees earned by forelgn students increased in all fields between 1977 and 1989. Growth was greatest in mathematics. By 1989, forelgn students were earning nearly one-half of the doctorates conferred in mathematics and in engineering.
- The number of foreign students earning doctorates increased more than $\mathbf{1 0 0}$ percent during the 1977-89 period, whereas the number of Americans earning such degrees decilined 5 percent. The decline in American doctorate reciplents occurred during a period of growth ( $\mathbf{3 6}$ percent) in the $\mathbf{2 5}$ - to $\mathbf{3 4}$-year old college graduate population. Although the number of American reciplents has Increased since 1985, growth has been slower than growth in the number of college graduates aged 25-34.
- Of the forelgn students earning doctorates in the natural and computer sciences and engineering in 1989, 39 percent had definite postgraduate plans in the United States, 15 percent for employment and 24 percent for further study.

Doctor's degrees earned by foreign and American students: 1977 and 1989

| Field of study | Percent earned by foreign students |  | Percent change in number of degrees,1977-1989 |  |
| :---: | :---: | :---: | :---: | :---: |
|  | 1977 | 1989 | Foreign students | American students |
| All fields | 11.3 | 21.5 | 105.0 | -4.6 |
| Humanities and social/behavioral sciences | 7.4 | 12.9 | 59.0 | -14.4 |
| Natural sciences | 13.7 | 25.6 | 104.9 | -5.8 |
| Life sciences | 10.1 | 16.0 | 65.8 | -2.9 |

## F. Output and Productivity of Colleges and Universities

Indicator 2:22 Higher education spending on research and development
The Nation's institutions of higher education are an important source of new scientific and technological knowledge. Resear?h and development expenditures at doctorate-granting institutions provide one measure of higher education's coritribution to that knowledge.

- Constant dollar R\&D expenditures at doctorate-granting institutions increased each year between 1974 and 1989. The highest, most sustained growth occurred during the mid- to late-1980s.
- In the first half of the 1980s, R\&D expenditures at doctorate-granting institutions declined relative to national R\&D expenditures. The downward trend ended In 1984, and since 1985, doctorate R\&D has grown as a percent of national R\&D. In 1989, the ratio of dectorate to national R\&D was at its highest level for the 1972-1989 period.
- Federal funds are by far the most important source of R\&D expenditures at doctorate-granting institutions. However, these funds decilned relative to other sources during the 1972-89 period. While funds from all sources increased in constant dollars over the period, federal funds grew much more slowly than funds from Industry and from Institutional resources.

Research and development expenditures: Selected fiscal years 1972-1989

| Fiscal year | At doctorate-granting institutions |  |  |  |  |  |  | Total national |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

II. Context

College enrollment increased substantially during the late 1960s and 1970s as the post-World War II baby boomers came of college age. Enrollment increased by onethird in the 5 years between 1967 and 1972.' It increased another one-third between 1972 and 1981, at which time those born at the peak of the baby boom (1957) would be finishing college (supplemental table 2:23-1). However, between 1983 and 1985, as the size of the traditional college-going age group began to decline, enrollment declined only slightly (supplemental table 2:23-4). This was due to: (1) higher enrollment rates among 16 - to 24 -year-olds and (2) higher enrollment rates among females $25-34$ years old. ${ }^{2}$ Between 1985 and 1989, total enrollment was rising again. The number of first-time freshmen is a leading indicator of future enrollment. The number of first-time freshmen at 4 -year colleges drifted downward during most of the 1980s. ${ }^{3}$ However, in 1988 it increased to its highest level during the 1980s but in 1989 fell back slightly.

Between 1972 and 1989, enrollment increased in all sectors of higher education, but it increased the most in public 2 -year colleges. Their share of total enrollment increased from 29 to 36 percent during the period. In contrast, public 4 -year institutions' share of enrollment dropped from 48 percent in 1972 to 42 percent in 1989.

[^29]
## G. Size and Growth

## Indicator 2:23 College and university enrollment, by type and control of institution

Colleges and universities offering 2- and 4-year programs under public and private control address somewhat different student needs. Fluctuations in enrollment trends may indicate, among other things, changes in student interest in the various kinds of services offered, changes in the cost of attendance, and changes in the availability of student financial aid.

- Enrollment in higher education increased 46 percent between 1972 and 1989. Following a decine in the mid-1980s, enrollment rose each year after 1985, desplte a substantial decline in the number of high school graduates aged 20-24.
- Since 1972, with the exception of a brief period in the early to mid-1980s, enroliment In public 2-year Institutions has grown at a faster rate than enrollment in 4 -year institutions, public or private. These differences in growth rates were especially large during the 1970 s.
- The share of students enrolled in different types of institutions changed somewhat in the 1970s. Public 2-year institutions increased their share, from 29 to 36 percent, mainly at the expense of public 4 -year institutions. Institutional shares remained stable during the 1980 s.
- In 1989 as in 1972, public institutions accounted for over three-fourths of higher education enrollment.

Enrollment in higher education, by type and control of institution, and high school graduates, by age: Selected years 1972-1989

| Year | Percent change since 1972 |  |  |  | Percei.. of total enrollment |  |  |

## H. Student Characteristics

The characteristics of postsecondary students are not static. As they change, the types and quantity of services provided by colleges and universities also may change to meet the needs of different types of students.

Between 1976 and 1988, the racial and ethnic makeup of college students changed somewhat. The proportion of students who were white and non-Hispanic fell 3.8 percentage points as the proportion from minority groups increased (Indicator 2:24). However, the increase was not uniform among the various minority groups. The proportion of students who were black and non-Hispanic fell slightly, from 9.4 to 8.7 percent. The largest relative increase was among Asians, whose representation more than doubled from 1.8 to 3.8 percent of college students. The representation of Hispanic students also increased from 3.5 to 5.2 percent of college students. These changes were general, occurring in public as well as private, in 2 -year as well as 4 -year colleges and universities.

The types of institutions in which various racial and ethnic groups tend to enroll vary. For instance, in 1988, there were 1.2 black students for every Hispanic enrolled in 2 -year colleges, but 2.2 black students for every Hispanic enrolled in a 4 -year college (supplemental table 2:24-1). Much of this difference may be attributable to differences in the geographic distribution of the black and Hispanic populations in the United States. There is a high concentration of Hispanics in California, a state with a very large 2 -year college system.

In 1988, fewer Asians students were in public higher education than blacks or Hispanics- $-406,000$ Asians compared to 881,000 non-Hispanic blacks and 587,000 Hispanics. However, enrollment of Asians was equal to Hispanics in private and 4 -year institutions, and was substantially less than Hispanics in public and 2-year institutions (supplemental table 2:24-1).

The proportion of higher education students who are foreign, that is, nonresident aliens, increased from 2.0 to 2.8 percent between 1976 and 1988. These students were concentrated in private colleges-4.3 percent of private college enrollment compared to 2.3 percent of public college enrollment-and in 4 -year colleges- -3.7 percent of 4 -year college enrollment compared to 1.2 percent of 2 -year college enrollment.

As the post-World War II baby boom cohorts grew older and the "baby bust" cohorts that followed them reached college age, the age distribution of college students changed. In 1989, 12 percent of undergraduates were 35 years old or over, up from 8 percent in 1976. Only 54 percent of undergraduates were 21 years old or under in 1989, down from 62 percent in 1976 (Indicator 2:25). These deriographic trends have affected both 4 -year and 2 -year colleges. For example, in 1989, 9 percent of
undergraduates at 4 -year colleges were 35 years old or over, up from 5 percent in 1976; in 1989, 59 percent were 21 or younger, down from 69 percent in 1976 (supplemental table 2:25-1).

In the mid-1970s, about 22 percent of undergraduates 16 - 34 years old indicated they attended parl-time (supplemental table 2:25-8). That increased to 25 percent in 1977, and had not changed appreciably by 1989, when 26 percent indicated they attended part-time. Students attending 2 -year colleges are more likely to attend part time than students attending 4 -year colleges. However, students $25-34$ years old, whether attending 2 -year or 4 -year colleges, are more likely to attend part-time than students $16-24$ years old.

Graduate students are also more likely to attend part-time. They accounted for 16 percent of all students 16-34 years old in 1989 (supplemental table 2:25-9). In the absence of other changes, as the baby boom cohort ages, the graduate student share of total enrollments is expected to decline.

In summary, the likelihood that a college student would be over 25 or enrolled part time was higher in the 1980s than it was in the 1970s. Also, the percentage of Asian and Hispanic students increased somewhat.

## Indicator 2:24 Racial/ethnic distribution of college students

Changes in the racial/ethnic mix of college enrollment suggest changes in the needs, interests, and backgrounds of the student body. They thus provide clues to the need to alter student programs and services.

- Between 1976 and 1988, the college student body became somewhat more heterogeneous. Minority students increased from 15 to 18 percent and nonresident aliens from 2 to 3 percent of total enrollment.
- As a percent of college students, blacks declined slightly whereas Hispanics and Asians increased in the 1976-88 period. In 1988, blacks made up 9 percent, Hispanics 5 percent, Asians 4 percent, and American Indians 1 percent of enrolled students.
- Minority students made up a higher proportion of the student body at 2-year than at 4 -year institutions ( 23 vs. 16 percent in 1988) and at public than at private institutions (19 vs. 15 percent in 1988).

Percent of total enrollment, by race/ethnicity: Selected years 1976-1988

| Year and type and control of institution | White, non-Hispanic | Black non-Hispanic | Hispanic | Asian | American Indian | Nonresident alien |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | All institutions by year |  |  |  |  |  |
| 1976 | 82.6 | 9.4 | 3.5 | 1.8 | 0.7 | 2.0 |
| 1980 | 81.4 | 9.2 | 3.9 | 2.4 | 0.7 | 2.5 |
| 1984 | 80.2 | 8.8 | 4.4 | 3.2 | 0.7 | 2.7 |
| 1986 | 79.3 | 8.7 | 4.9 | 3.6 | 0.7 | 2.8 |
| 1988 | 78.8 | 8.7 | 5.2 | 3.8 | 0.7 | 2.8 |
|  | By type and control of institution: 1988 |  |  |  |  |  |
| Public | 78.4 | 8.7 | 5.8 | 4.0 | 0.8 | 2.3 |
| Private | 80.3 | 8.6 | 3.2 | 3.2 | 0.4 | 4.3 |
| 4-year | 80.5 | 8.0 | 3.6 | 3.6 | 0.5 | 3.7 |

## Indicator 2:25 Age of undergraduate college students

Students may be older if they are coming back to college to leanın new skills for a new career or if, for a variety of reasons, they were not able to attend or complete college during the traditional college attendance ages. Older college students are more likely to have full-time jobs and family responsibilities. Thus, they are more likely to attend part-time and to live off-campus. To serve the needs of older students colleges may offer more evening classes and classes that meet only once a week.

- In 1989, 12 percent of undergraduates were 35 years old or over, up from 8 percent in 1976. Among part-time undergraduates, the share increased from 23 to 29 percent between 1976 and 1989.
- Only 54 percent of undergraduates were 21 years oid or under in 1989, down from 62 percent in 1976.
- In 1989, 71 percent of full-time students were 21 years old or under, but only 17 percent of part-time students were. In contrast, 29 percent of part-time students were 35 years old or over compared to $\mathbf{5}$ percent of full-time students.
- About 1 in 4 undergraduate students 16-34 years old attends part-time. This rate increased from 20 percent in 1973 to 25 percent in 1977 and since has changed very little (suppiemental table 2:25-8).

Age distribution of undergraduate students 16 years old and over, by attendance status: 1976 and 1978-1989

| Year | Total |  |  | Full time |  |  | Part time |  |  |

# III. Resources 

## I. Fiscal Characteristics

The 1980s presented many fiscal challenges to colleges and universities. Enrollment growth slowed and it shifted toward part-time enrollment. After the high inflation years of the late 1970s, colieges found that their expenses had increased faster than their tuition charges. The federal budget deficit grew, which led to added scrutiny of all federal programs. In contrast the 1980s started with a recession, but eventually were characterized by low inflation and moderate growth.

In this context, colleges and universities increasingly relied on tuition and fees as a source of revenue. In 1980, tuition and fees were 16 percent of all revenues at public colleges and universities; by 1987, they had increased to 19 percent. At private, nonprofit colleges and universities in 1980, the share of revenues from tuition and fees was 52 percent; by 1987, 57 percent (computed from supplemental table 2:26-2).

Spending per student increased moderately in public institutions during the 1980s, increasing 8 percent in universities ard 4 percent in other 4 -year and 2 -year institutions from 1980 to 1987. In private institutions spending per student increased more-27 percent in universities and 19 percent in other private 4 -year colleges.

Increases in tuition charges grew faster than expenditures during the 1980s. Among public institutions, tuition c'narges increased 26 percent at universities and 19 percent at 2 -year colleges between 1980 and 1987. Amony private institutions the increases were larger-36 percent at universities and 30 percent at other 4 -ysar colleges (Indicator 2:27). Off-setting some of the increases in tuition were increases in institutionally-based scholarships and fellowships. These expenditures increased 19 percent at public universities, but fell slightly at other 4 -year public colleges. At public institutions, 16 percent of undergraduates received institutional aid in 1986-87 (Indicator 2:28). Expenditures for scholarships and followships increased 50 percent at private universities and 47 percent at other 4 -year private colleges. At private, nonprofit colleges and universities, 49 percent of undergraduates received institutional aid in 1986-87.

Most students attending postsecondary institutions receive some financial aid (Indicator 2:28). When students use financial aid to pay tuition charges, the aid represents revenue to the institution (when the financial aid is from federal or state sources). At public institutions, 40 percent of undergraduates received aid from federal sources in 1986-87. At private, nomprofit institutions 56 percent of undergraduates received aid from federal sources; at proprietary institutions, 82 percent of students receive aid from federal sources.

## I. Fiscal Characteristics

## Indicator 2:26 Revenues of colleges and universities

There aie more than 3,000 colleges and universities in this country-from community colleges to liberal arts colleges to proiessional schools to research universities. About 1,500 of these institutions are governed by localities or by states primarily to serve their populations. Some 1,800 more are under private control, some religious and some independent. All institutions of higher education are supported by the same array of funding sources, but to widely varying degrees, depending upon whether they are publicly or privately controlled. These sources in turn are affected by a number of factors, including fluctuations in the economy arid perceptions of whether investments, be they in the form of taxes, gifts, or tuilion payments, are yielding expected benefits-to individuals or to the country.

- In 1987, state and local appropriations were the largest source of funds for public institutions ( 57 percent) but a negligible source ( 1 percent) for private institutions.
- Private institutions depend primarily on tuition and fees as a source of revenue-57 percent in 1987.
- In 1987, revenues from tuitions and fees for ail colleges were more than $\mathbf{5 0}$ percent greater (in constant dollars) than in 1976. The share of revenues from tuition and fees was 31 percent, up from 27 percent in 1976. Revenues from state and local appropriations increased only 20 percent (computed from supplemental table 2:26-2).

Percentage distribution of general education revenues of higher education, by type and control of institution and source of revenue: Fiscal year 1987

| Sources of revenues | Type of institution |  |  |
| :---: | :---: | :---: | :---: |

## I. Fiscal Characteristics

## Indicator 2:27 Allocation of expenditures per student and tuition levels

Rising college tuition is of considerable concern to policymakers, educators, students and their families. Why tuition continues to climb is a hotly debated subject. Information on where colleges and universities spend their money and how expenditure patterns have changed in relation to tuition enhances the public debate.

- At public universities, between 1977 and 1987, tuition charges and expenditures per full-time-equivalent ( $F, E$ ) student for administration and research increased about 20 percent (in constant dollars) while expenditures per FTE student for instruction increased 9 percent.
- At private universities, tultion charges Increased 34 percent while expenditures for instruction Increased 30 percent. Expenditures for administration and for institutionally based scholarships increased about 47 percent (supplemental table 2:27-2).
- At public universities during the 1986-87 academic year, expenditures per full-time equivalent student for instruction were slightly higher than they were the previous year. At other public 4 -year colleges they were slightly lower. Expenditures for administration showed a larger increase at public 2-year colleges than at other public institutions (supplemental table 2:27-1). Tuition charges showed a similar pattern of slight increases or decreases in public institutions.
Indices of selected expenditures per full-time-equivalent student and average undergraduate tuition charges (in constant dollars) at public and private universities: Academic years ending 1977-1987
(1977=100)

## I. Fiscal Characteristics

Indicator 2:28 Student financial aid, by type and control of institution and degree level

Student financial aid is important to postsecondary institutions because it enhances their ability to serve students from all types of economic backgrounds. This indicator shows the proportion of undergraduate and graduate students enrolled in different types of institutions in the fall of 1986 who received aid from various sources.

- Six out of 10 indergraduates enrolled full-time recelvad some form of student financlal sid in fall 1986. The proportion recelving aid was higher in private institutions, particularly in those operated for proftt, than in public institutions.
- Federal aid was the most common source of aid among full-time undergraduate students, especially among those enrolled in private, for-profit institutions.
- Among full-time undergraduates, institutional ald was much more common among those enrolled in private, nonprofit institutions than it tams among those enroiled in other types of instifutions.
- Nearly three-fourths of full-time postoaccaleureate students recelved student financial aid. Institutional aid was the most common suurce at the master's and doctor's degree levels, and foderal aid was the most common source at the firstprofessional degree level.
- A substantial proportion of part-time students received student financial ald: nearly 3 out of 10 at the undergraduate level and close to 4 out of 10 at the postbaccalaureate level (supplemental table 2:28-2).

Percent of full-time students receiving financial aid, by source of aid: Fall 1986

| Degree level and control of institution | Any aid | Federal | State | Institutional | Other |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Undergraduate |  |  |  |  |  |

## J. Faculty

The faculties of the Nation's colleges and universities are a vital national resource. 'They transmit knowledge to new generations of citizens and perform research important to our economic, social, and political life. An impnrtant question is how able higher education is to attract and retain qualified people in academic careers. ${ }^{1}$ Another important question is how do faculty use their time? These questions arise because of concerns about the quality of undergraduate teaching, but they are also related $\mathfrak{t})$ the productivity of faculty, their salaries, and the costs of a college education.

College faculty do not spend all of their time teaching, but how much they teach varies rreatly in different types of schools. At research universities and medical schools, faculty spend less than half of their time teaching (Indicator 2:29), while those at liberal arts colleges spend almost two thirds of their time teaching. In addition, faculty at research universities and medical schools receive a higher basic
lary and more other earnings than do faculty at liberal arts colleges (supplemental able 2:30-1). It is likely that faculty with strong research skills are more difficult to find, and so, to retain them, colleges must pay them more. Despite the smaller percentage of their time spent teaching, faculty at research institutions do not have fewer contact hours with students than faculty at liberal arts colleges (Indicator 2:29). This is due to a much larger average class size (measured by student contact hours per classroom hour) at research institutions. This leaves open the question of the effect of the larger class sizes on the quality of instruction.

Earnings other than basic salary are a significant source of income for faculty. More than three quarters of all full-time faculty receive earnings in addition to their basic salary (supplemental table 2:30-1). Those who receive other earnings receive on average one-third more earned income than those who do not (supplemental table $2: 30-2$ ). Full-time faculty at 4 -year colleges and universities in the humanities receive on average 10 percent of their earned income from sources other than their basic salary; business faculty receive 20 percent from other sources.

Varying the teaching workload and allowing faculty to receive income from outside sources are important elements of the ability of colleges and universities to attract and retain qualified people in academic careers. This ability is particularly important today in view of the expected retirement of large numbers of faculty in a decade or

[^31]so. ${ }^{2}$ Many of today's faculty began their careers during the 1950 s and 1950 s when higher education was expanding very rapidly. These faculty will be approaching retirement age during the late 1990s and early 21st century. Exactly when these faculty will retire is uncertain, of course. This is particularly true given that many expect policies of mandatory retirement at age 70 to disappear in 1994. However, when these faculty do begin to retire, there may be an increased demand for new faculty.

[^32]
## J. Faculty

## Indicator 2:29 Teaching workload of full-time faculty, by type of institution

The amount of time college and university faculty devote to teacning versus research and other activities relates to several issues, including instructional quality, the attraction and retention of qualified faculty, and the promotion of scholarship.

- The proportion of time that full-time faculty spend on teaching varies considerably by type of institution, from a high of 71 percent among those in 2 -year institutions to a low of 26 percent among medical school faculty.
- Faculty in research and medical institutions spent more than one-quarter of their time on research activities. The ratio of teaching to research time in these institutions is 1.5 and 1.0, respectively. This compares to ratios of 6.0 and 7.7 for faculty in comprehensive and liberal arts instifutions.
- Faculty in liberal arts and comprehensive institutions spend a greater number of hours in the classroom but have fewer student contact hours per classroom hour than faculty in research and doctoral instifutions.

Time spent teaching and on research, classroom hours, and student contact hours of full-time faculty, by type of institution: Fall 1987

| Type of institution | Percent of time spent teaching | Percent of time spent on research | Mean classroom hours | Mean student contact hours | Student contact hours per classrocm hour (Mean) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| All | 55.7 | 16.1 | 9.8 | 301.6 | 33.9 |
| Medical | 26.5 | 27.0 | 6.3 | 237.3 | 41.3 |
| Research | 45.0 | 29.6 | 6.4 | 250.1 | 41.9 |
| Doctoral | 54.3 | 20.6 | 8.5 | 283.8 | 37.9 |
| Comprehensive | 62.8 | 10.4 | 10.6 | 306.8 | 29.4 |
| Liberal arts | 64.8 | 8.4 | 10.6 | 236.6 | 23.2 |
| Two-year | 71.3 | 3.4 | 15.2 | 422.0 | 28.6 |

NOTE: All medical faculty, regardless of institutional affiliation, are classified under "Medical." Student contact hours are the number of hours per week spent teaching times the number of students in each class, summed over all classes. Mean student contact hours measures the average amount of instructional time per week faculty spend with students. Mean student contact hours per classroom hour meas' ${ }^{\prime \prime}$ :s average class size. See supplemental note 2:29 for other definitions.

## J. Faculty

## Indicator 2:30 Faculty salaries and total earnings of full-time faculty in institutions of higher education

Compensation is an important element in the attraction and retention of qualified faculty. In evaluating the adequacy of full-time faculty salaries, it is important to look at faculty receipt of earnings from other sources and the amount of total earned income in addition to the size of the salaries themselves.

- Over three-quarters of full-time faculty receive earnings in addition to their basic faculty salary.*
- The proportion of total earnings derived from sources other than the basic faculty salary ranges from 10 persent among humanities faculty to 20 percent among business faculty. Among institutional types, it ranges from 11 percent in liberal arts institutions to 19 perceris in medical schools (supplemental table 2:30-1).
- Faculty in the health sciences have the highest and those in the humanities and education the lowest basic salaries and total earnings.
- Receipt of earnings in addition to the basic faculty salary makes a substantial financial dife mence to full-time faculty. The total earnings of recipients average onethird higher than those of nonrecipients (supplemental table 2:30-2).

High School Class of 1972, Postsecondary Education Transcript Study.

## Supplemental note 2:2 Continuation to college rates

Three longitudinal surveys were used as the basis for calculating delayed continuation to college. These are the National Longitudinal Study of the High School Class of 1972 (NLS-72), and the High School and Beyond studies of 1980 Seniors (HS\&B Seniors) and Sophomores (tiS\&B Sophomores). These longitudinal surveys are ideal for describing for a particular graduating class their patterns of attendance at postsecondary institutions, because the same sample is surveyed several times over a period of years following high school graduation. However, comparison of attendance patterns between graduating classes is more difficult, because the methods of data collection change, the timing of the surveys change, and the questions themselves change. The result is that there are more possible sources of nonsampling error when estimating differences between graduating classes than there are when estimating differences between groups within a graduating class. Thus, the reader should be more careful than usual not to interpret small estimated differences between graduating classes as evidence of true differences. Some of the differences between the three samples are described below.

## National Longitudinal Study of the High School Class of 1972

This is a sample of over 22,000 seniors in high school in 1972. These seniors completed questionnaires in 1972, 1973, 1974, 1976, and 1979. A subsample of about 14,000 were sent questionnaires in 1986. As a supplement to these data a Postsecondary Education Transcript Study (FETS) ${ }^{1}$ was conducted during 1984-85. This study involved the collection and processing of school transcripts for all members of the NLS-72 cohort who had attended any form of postsecondary institution since leaving high school. Because members of the sample often attended more than one institution, a transcript was requestej from each institu ion liney attended. These transcripts contain information on the dates of attendance, courses taken, and credits earned. The estimates in table 2:2-3 were based on these PETS data. Included in the analysis were all individuals for whom at least one transcript was requested and received and who had attended at least one term before January 1976. I's insiivid. Is were excluded from the sample based on the number of credits attempied or successfully completed. The response rate was high-87 percent of requested transcripts were received. ${ }^{2}$ However, among

[^35]vocational and proprietary institutions it was low-55 percent. An adjustment was made for non-response, but results may nevertheless underestimate the percentage of first enrollment in a proprietary or vocational institution.

## High Schoo! and Beyond Senior Cohort

This is a sample of about 12,000 high school seniors in the spring of 1980. These seniors completed questionnaires in 1980, 1982, 1984, and 1986. Questions about ttendance at one or more postsecondary institution were a part of the 1982, 1984,
d 1986 questionnaires. Included among these questions was the date the 1. vidual started attending each institution and the date the individual left each in tution. These dates were then used to determine an individual's enrollment sta is in February and October of each year. The estimates in table 2:2-2 were basiad on those who participated in the 1984 followup and indicated they were enrolled at a postsecondary institution on at least one February or October before 1984.

## High School and Beyond Sophomore Cohort

This is a sample of about 15,000 high school sophomores in the spring of 1980. These sophomores completed questionnaires in 1980, 1982, 1984, and 1986. Questions about attendance at one or more postsecondary institution were a part of the 1984 and 1986 ruestionnaires. Included among the 1984 questions was the date the individual started attending each institution and the date the individual left each institution. The 1986 questions were more elaborate and allowed for the possibility of multiple instances of starting and stopping attendance at a particular institution. These dates were then used to determine an individual's enrollment status in February and October of each year. In a few instances individuals were attending more than one institution at the same time. The estimates in table 2:2-1 were based on those who participated in the 1986 followup who and indicated they had graduated from high school in 1982 and were enrolled at a postsecondary institution in at least one February or October beivre 1986.

In summary, there are two major differences in the type of data used to calculate date of first enrollment in postsecondary education in the 3 high school cohorts. First, table 2:2-3 (high school class of 1972) is based on transcript data, whereas table 2:2-2 (high school class of 1980) and table 2:1 (high school class of 1982) are based on student completed questionnaires. Second, some of the questions used as the basis for table 2:2-1 provided more detail on attendance patterns than did the questions used as the basis for table 2:2-2.

Indicator 2:3

${ }^{1}$ Expected family contribution defined using the Uniform Methodology. See supplemental note 2:4.
${ }^{2}$ Total cost includes tuition and fees, room and board, books, transportatiori. and other miscellaneous $7 x p e n s e s$.
${ }^{3}$ Net cost is total cost less grant aid, student loan amounts, and work-study sarnings.
${ }^{4}$ Adjusted net cost is total cost less grant aid : ... 40 percent of loan amounts. This adjustment is based on the estimate that each dollar of student loan has 40 cents of subsidy and the position that work-study earnings should not be regarded as aid because it requires the student to work.

## Supplemental note 2:4 Net cost of college attendance*

Definitions of terms used in tables for Indicator 2:4 are as follows:
Expected family contribution. Before a students gets any financial sid, a "needs analysis" isi berformed to determine what the student and parents of dependent students strild and can pay. This amount is called the expected family contribution (EFC), and is determined through an analysis of need based on taxable and nontaxable income and assets as well as family size, the number of family members attending postsecondary institutions, extraordinary medical expenses, and so forth. For dependent studerts the EFC consists of both a parental contribution and a separately calculated student contribution. Most students are considered dependent until they are 24 years old. The minimum student contribution in 1988-89 was \$700 for freshman and $\$ 900$ for other undergraduates. The Uniform Methodology (UM) was the needs analysis system that was in widespread use during the 1986-87 academic year, when the 1987 National Postsecondary Student Aid Study (NPSAS:87) was conducted (Indicator $2: 4$ is based on this study). In 1988-89, the Congressional Methodology (CM) was mandated for use by the federal government in awarding campus-based aid and Stafford Loans. At this time most users switched to the Congressional Methodology. The CM largely copies the UM. In NPSAS:87, the expected family contribution was collected from institution records for students receiving financial aid, and estimated based on other information for students not receiving financial aid.

Total cost of attendance. For the purposes of Indicator 2:4 this is defined as the costs actually incurred (and reported) by the student. This cost includes tuition, fees, room, board, books, transportation, and other miscellaneous expenses.

Net cost and aid. Net cost is defined as total cost less aid. For the purposes of Indicator 2:4, financial aid is defined to include grants and loans from all sources as well as earnings from work-study programs. Work-study is a generic term for programs designed to provide part-time employment as a source of funds to pay for postsecondary education as well as a federal program that is administered through postsecondary institutions. Net cost represents what the student and his or her parents must pay in the current year to attend a postsecondary institution.

Adjusted net cost and adjusted aid. Adjusted net cost is total cost less adjusted aid. Adjusted aid incli 'es grants and 40 percent of loans. Grants, also known as

[^36]scholarships, are funds for postsecondary education that do not have to be repaid. On the other hand, loans are borrowed money that must be repaid. Thus, for some purposes combining dollars of grants and dollars of loans may not be appropriate. Student loans usually do not accrue interest while the student is still enrolled in college, and after the student leaves college interest accrues at a rate that is lower than what can normally be obtained from banks for a non-secured loan (mortgages and automobile loans are secured). For each dollar of loan a student receives, the present value of what must be repaid is approximately 60 cents ( 40 cents is equivalent to a grant). The third component of aid, work-study earnings, requires the student to work and thus for some purposes should not be distinguished from earnings from other jobs. Adjusted net cost represents the present value of what the student and his or hor parents must pay in the current and future years to attend a postsecondary institution.

NOTE: The continuous attendance rate is the percentage of those enrolled the previous October who were enrolled again the following October. The grade level progression rate is the percentage of those who were enrolled both the previous and following Octobers who advanced at least one grade level.
SOURCE: U.S. Department of Commerce, Bureau of the Census, 1989 October Current Population Survey.

## Supplemental note 2:5 Persistence rates

The college student persistence rate is defined as the proportion of students enrolled the previous October who were enrolled in college again the following October. Calculating this rate requires distinguishing students who were enrolled in high school, college as undergraduates, and college as graduate students. The basis for distinguishing these groups is educational attainment. However, the October Current Population Survey (CPS) reports only current educational attainment, so educational attainment for the previous October must be inferred.

Educational attainment in the CPS is reported as "years of schooling completed." Individuals with 12 years of schooling completed are regarded as high school graduates, 16 years completed as college graduates, and so on. Years of schooling completed is based on the responses to two questions: 1) "What is the highest grade . . . ever attended?" and 2) "Did . . . complete it?" For example, an individual who responds that the highest grade he ever attended was first year of college and that he did not complete it, is regarded as having completed 12 years of schooling.

For the purpose of calcule ting the persistence rate, two assumptions are made:

- First, respondents who were enrolled the previous October are assumed to have then reached their highest grade attended if they were not enrolled again the following October. This assumption would oversiate the level for those who made the transition to the next level in mid-year.
- Second, respondents who were enrolled in October are assumed to have been in the highest year completed the previous October. This would understate the level for those who attended part time and had not made the transition to the next level during the previous year.

Consider three examples. First, those who were enrolled in the previous October, but not in the following October, and whose highest grade attended is 13 are assumed to have been freshmen in the previous October. Second, those who were enrolled in the previous October as well as the following October, and whose highest grade completed is 13 years of schooling, are assumed to have been freshmen in the previous October. Third, those who were enrolled in the previous October, but not in the following October, and whose highest grade completed is 16 years of schouling, are assumed to have been college seniors in the previous October. Some students may be misclassified, but if the extent of misclassification is not very different across groups or over time, then differences between groups and changes over time are useful, although the inferred level may be high or low.

- Not available.
' Total science includes natural sciences (life arid physical), mathematics, computer and information sciences, health sciences and allied fields, and agriculture sciences and natural resources.
${ }^{2}$ Estimated by the number of 20 - to 24 -year-olds at the end of the academic year divided by 5 . When population data for the end of the academic year were not available, the year before or after was used.
SOURCE: Unesco Statistical Yearbook, 1989 and eariier editions; U.S. Department of Education, National Center for Education Statistics, Digest of Education Statistics, 1989; U.S. Department of Commerce, Bureau of the Census, unpublished tables.

## Indicator 2:8

## Supplemental note 2:8 Sources of data

Sources of data used in Indicator 2:8 are as follows:
Sources of U.S. data. All data on number of graduates for the U.S. are taken from the Digest of Education Statistics, 1990, Tables 220, 241, 245, 247, 252, 253, 255, and 255. Population data for the U.S. is the total resident population in July of the year ending the academic year and is taken from U.S. Population Estimates, by Age, Sex, Race, and Hispanic Urigin: 1989, Current Population Reports, Series P-25, No. 1057 and earlier editions. The modal age of college graduation in the U.S. is 22 which is estimated by the number of 20- to 24 -year-olds in July of the year ending the academic year divided by 5 .

Sources of data for other countries. All data on riumber of university graduates for the other countries is taken from the Unesco Statistical Yearbook, 1990 and earlier editions, table on education at the third level. Population data for other countries was provided by the Bureau of the Census in unpublised tabulations. If population estimates were not available for the year ending the academic year, the closest available year was used.

NOTE: The minority fielc' concentration ratio is calculated as: the percent of a minority group earning bachelor's degrees who majoied in a selected field divided by the percent of whites earning bachelor's degrees who majored in the same field. Exampie: The 1989 biack to white concentration ratio for education $=7.3 / 10.2=.71$. As measured here, blacks are non-Hispanic.

"The index of dissimilarity is calculated as: the sum of the absolute differences betw'een the proportion of minority and white students majoring in each of the fields divided by 2. It was calculated here from the 10 most detailed categories shown above. The index represents the percentage of the minority group who would have to change fields in order for the group to have the identical field distribution of white students.

NOTE: Distributions for 1985 and later years inciude degrees for which missing race/ethnicity data could be imputed. The number of degrees reported for 1977 and 1979 exclude those conferred by U.S. Service Schools ( 0.4 percent or less of degreas).

SOURCE: U.S. Department of Education, National Center for Education Statistics, IPEDS/HEGIS surveys of degrees conferred, various years.

| Index of dissimilarity ${ }^{*}$ | 24.9 | 24.4 | 23.9 | 23.7 |

## Indicator 2:10

*The index of dissimilarity is calculated as: the sum of the absolute differences between the proportion of men and women majoring in each of the fields divided by 2. It is calculated here from the 10 most detailed categories shown above. The index represents the percentage of a group who would have to change occupations in order for the group to have the identical occupation distribution of a comparison group.

NOTE: Detail may not add to totals due to rounding. Totals for 1988 and 1989 include those for whom field of study is unknown.

| Index of dissimilarity* | 8.5 | 9.8 | 10.0 | 9.9 | 5.6 | 3.3 |

"The index of tissimilarity is calculated as: the sum of the absolute differences between the proporion of minority and white students majoring in each of the fields divided by 2 . It was calculated here from the 10 most detailed categories shown above. It represents the percentage of one group who would have to change fields in order for the group to have the iden al field distribution of the other.

NOTE: Distributions for 1985 and later years include degrees for which missing race/ethnicity could be imputed. The number of degrees reported for 1977 and 1979 exclude those conferred by U.S. Service Schools ( 0.4 percent or less of degrees).

SOURCE: U.S. Department of Education, National Center for Education Statistics, IPEDS/HEGIS surveys of degrees conferred, various years.

| Other technical/proiessional | 6.7 | 5.2 | 8.1 | 8.3 | 11.5 | 8.5 |
| Index of dissimilarity* | 10.1 | 14.3 | 12.0 | 10.2 | 8.5 | 9.1 |

*The index of dissimilarity is calculated as: the sum of the absolute difference between the proportion of minority and white students majoring in each of the fields divided by 2. It was calculated here from the 10 most detailed categories shown above. It represents the percentage of one group who would have to change fields in order for the group to have the identical field distribution of the other.

NOTE: Distributions for 1985 and later years include degrees for which missing race/ethnicity could be imputed. The number of degrees reported for 1977 and 1979 exclude those conferred by U.S. Service Schools ( 0.4 percent or less of degrees).

SOURCE: U.S. Department of Education, National Center for Education Statistics, IPEDS/HEGIS surveys of degrees conferred, various years.

- Too few sample cases for a reliable estimate.
* The procedure for estimating the standard error of the median does not account for a large number of sample respondents earning the median salary. In this case the procedure produced an estimate of zero due to a group of approximately 5 percent of the sample earning the median salary. The standard error although small is not zero.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Recent College Graduates surveys.

## Supplemental note 2:18 Labor force statistics

The Bureau of Labor Statistics uses three categories to classity the labor force status of an individual: (1) employed, (2) unemployed, and (3) not in the labor force. An emplnyed individual is someone with a job and working. Also included are those not working h.!t with jobs from which they are temporarily absent because of illness, vacation, labor-management disputes, bad weather, and personal reasons. Those in the military are also counted as employed. An unemployed individual is someone without a job, available for work, and who has made specific efforts to find employment some time during the prior 4 weeks. Also included are persons waiting to be recalled to a job from which they had been laid off or are waiting to report to a new job within 30 days. Individuals who are neither employed nor unemployed are not in the labor force.

Th sor force comprises all persons classified as employed or unemployed. The unemployment rate represents the number unemployed as a percent of the labor iurce. The labor force participation rate is the ratio of the labor force to the popuiation. The employment-population ratio is the percentage of employed individuals in the population. We refer to the last statistic as the employment rate in Indicator 2:18.

Each of these statistics is typically reported in two forms, one that includes the military and one that excludes them. For instance, the civilian employmentpopulation ratio is the percentage of all employed civilians in the civilian noninstitutional population. The civilian labor force participation rate is the ratio of the civilian labor force to the civilian non-institutional population. The labor force statistics reported in Indicator 2:18 and its associated supplemental tables are all for the civilian non-institutional population.

Each of these measures can be computed for groups classified by age, sex, race, Hispanic origin, etc.

Further elaboration on these labor force statistics is available in the explanatory notes of Employment and Earnings, published monthly by the Bureau of Labor Statistics of the U.S. Department of Labor.

Indicator 2:19

Table 2:19-1 Ratio of median annual earnings of male wage and salary workers 25 to 34 years old with 9-11, 13-15, and 16 cr more years of school to those with 12 years of school, by race/ethnicity: 1975-1989

- Not applicable.
* Based on estimated 1990 GNP implicit price deflator.

NOTE: R\&D expenditures include separately budgeted expenditures for basic research and for applied research and development. They do not include expenditures by university-administered, federally funded research and development centers (FFRDC's). R\&D expenditures at doctorate-granting institutions made up 98 percent of total academic R\&D expenditures in 1989. Data for 1981-1987 are revised from previously published figures.

SOURCE: National Science Foundation, Selected Data on Academic Science/Engineering R\&D Expenditures FY 1989 and National Patterns of R\&D Resources: 1990 (based on surveys of R\&D expenditures in government, industry, higher education institutions, and other sectors, various years).

Table 2:22-2 Percentage distribution of research and development expenditures at doctorate-granting institutions, by source of funds: Fiscal years 1972-1989

| Year | Total | Federal government | State/ local government | Industry | Institutional funds | Other |

## Supplemental note 2:26 Revenues of colleges and universities

General education revenue as used in this indicator excludes four categories of revenue received by many institutions:

- sales and services of auxiliary enterprises;
- sales and services of nospitals;
- independent operations (federally funded research and development centers);
- other sources.

In addition, the amount of funds reported for Pell Grants has been subtracted out of the tuition income ficure.

| 1987 | 121 | 112 | 118 | 134 | 133 | 117 |  |

NOTE: Tuition charges (tuition and fees) are in constant dollars, adjusted by the Higher Education Price Index for the academic year (July 1-June 30). They are for the entire academic year and are average charges paid by students. They were calculated on the basis of full-time-equivalent undergraduates. Tuition at public institutions is the charge to in-state students. The amount at private institutions includes charges at beth nonprofit and proprietary schools.

## Supplemental note 2:29 Definitions

## Type of higher education institution

Medical school: Institution classified by the Carnegie Foundation as a specialized medical school. For nurposes of indicators 2:29 and 2:30, this category also includes faculty in other institutions whose field of teaching is medicine.

Research university. Institution which is among the 100 leading universities in Federal research funds. Each of these universities awards substantial numbers of doct:rates across many fields.

Doctoral university: Institution that offers a full range of baccalaureate programs and Ph.D. degrees in at least three disciplines, but tends to be less focused on research and receives fewer federal research dollars than the research universitios.

Comprehensive institution: Instiiution that offers literal arts and professional programs. The master's degree is the highest degree offered.

Liberal arts institution: Smaller and generally more selective institution than comprehensive colleges and universities. Primarily offers bachelor's degrees, although some offer master's degrees.

Two-year institution: Institution that offers certificate or degree programs through the Associate of Arts level and, with few exceptions, offers no baccalaureate programs.
"Other" institution: Specialized institution that offers degrees ranging from the bachelor's to the doctorate, at least helf of which are in a single specialized field. Includes schools of law, engineering, business, art, etc. but not medical schools.

Note: For purposes of this indicator, all medical faculty, regardless of institutional aftiliation, are classified under "Medical school." These faculty are excluded from other types of institutions.

## Time allocation

Survey respondents were asked to estimate the percentage of their total working hours suent on each of 13 activities. For this indicator, the 13 activities are collapsed into the six categories listed beiow.

Teaching: Teaching, advising, or supervising students; grading papers, preparing courses, developing new curricula, etc.

Research: Research, scholarship; preparing or reviewing articles or books; attending or preparing for professional meetings or conferences, etc.; seeking outside fundiing (including proposal writing).

Administration: Administrative activities (including paperwork; staff supervision; serving on in-house committges, such as the academic senate, etc.); working with student organizations or intramural athletics.

Community service: Paid or unpaid community or public service.
Professional development. Taking courses; pursuing an advanced degree; other professional development activities, such as practice or other activities to remain current in one's field.

Other work: Providing legal or medical services or psychological counseling to clients or patients; outside consulting or freelance work; working at self-owned business; other employment; giving performances or exhibitions in the fine or applied arts; speeches; any other activities.

## Classroom and student contact hours

Classroom hours: The number of hours per week spent teaching, as reported by the faculty respondent.

Siudent contact hours: The sum over all classes of the number of hours per week spent teaching times the number of s'udents for each class, as reported by the faculty respindent.

Student contact hours per classroom hour. Total student contact hours divided by the number of classroom hours per week calculated for each faculty member.

## Indicator 2:30

Table 2:30-1 Receipt of earnings in addition to the basic faculty salary, mean basic faculty salary, and mean total earned income among full-time faculty in institutions of higher education, by type of institution and principal field of teaching: Fall 1987

| Principal field of teaching and type of institution | Percent with earnings in addition to basic faculty salary | Mean <br> basic faculty salary (BFS) | Mean total earned income (TEI) | $\begin{gathered} \text { BFS as a } \\ \text { percent of } \\ \text { TEI (mean) } \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: |

## Principal field of teaching

## Supplemental note 2:30 Definitions

## Sources of Earned Income

Basic faculty salary: Income received from the academic institu'ion as indicated by the faculty respondent under a category called "basic salary."

Other income from the academic institution: Income, including the estimated value of nonmonetary compensation (e.g., food, housing, car), received for administration, research, coaching, summer session teaching, or other activities not included in the basic salary.

Consulting income: Income received from sources other than the academic institution for legal or medical services, psychological counseling, outside consulting, freelance work, professional performances or exhibitions, speaking fees, or honoraria.

Other outside income: Income received from sources other than the academic institution, including other academic institutions, self-owned businesses (other than consulting), royalties, commissions, nonmonetary compensation from other sources, retirement income, grants or research income, or any other employment.

Total earned income: The sum of all of the above sources.

## General Information

The information presented in this report was obtained from many sources, including federal and stat6 igencies, private research organizations, and professional associations. The data were collected using many research methods including surveys of a universe (such as all colleges) or of a sample, compilations of administrative records, and statistical projections. Users of The Condition of Education should take particular care when comparing data from different sources. Differences in procedures, timing, phrasing of questions, interviewer training, and so forth mean that the results from the different sources are not strictly comparable. Following the general discussion of data accuracy below, descriptions of the information sources and data collection methods are presented, grouped by sponsoring organization. More extensive documentation of one survey's procedures than of another's does not imply more problems with the data, only that more information is available.

Unless otherwise noted, all comparisons cited in the text were tested for significance using $t$-tests and are significant at the .05 level. However, when multiple comparisons are cited, a Bonferroni adjustment to the signifance level was made. When other tests were used, they are described in the supplemental note for the indicator.

The accuracy of any statistic is determined by the joint effects of "sampling" and "nonsampling" errors. Estimates based on a sample will differ somewhat from the figures that would have been obtained if a complete census had been taken using the same survey ins. $\because$ events, instructions, and procedures. In addition to such sampling errors, all surveys, both universe and sample, are subject to design, reporting, and processing errors and errors due to nonresponse. To the extent possible, these nonsampling errors are kept to a minimum by methods built into the survey procedures. In general, however, the effects of nonsampling errors are more difficult to gauge than those produced by sampling variability.

The estimated standard error of a statistic is a measure of the variation due to sampling and can be used to examine the precision obtained in a particular sample for normally distributed statistics. The sample estimate and an ustimate of its standard error permit the constriction of interval estimates with prescribed confidence that the interval includes the average result of all possible samples. If all possible samples were selected, each of these surveyed under essentially the same conditions, and an estimate and its standard error were calculated from each sarıple then approximately 90 percent of the intervals from $\$ .6$ standard errors below the estimate to 1.6 standard errors above the estimate would include the aver:ige value from all possible samples; 95 percent of the intervals from two
standard errors below the estimate to two standard errors above the estimate would include the average value of all possible samples; and 99 percent of all intervals from 2.5 standard errcrs below the estimate to 2.5 standard errors above the estimate would include the average value of all possible samples. These intervals are called 90 percent, 95 percent, and 99 percent confidence intervals, respectively.

To illustrate this further, consider table 2:1-4 for estimates of standard errors from Cenus Current Population Surveys. For an estimate of the percent of 1989 high school graduates enrolled in college in October of 1989 of 59.6 in table 2:1-2, the table shows a standard error of 1.5 . Therefore, we can construct a 95 percent confidence interval from 56.6 to 62.6 ( $59.6 \pm 2 \times 1.5$ ). If this procedure were followed for every possible sample, about 95 percent of the intervals would include the average for all possible samples.

Standard errors can help assess how valid a comparison between two estimates might be. The standard error of a difference between two sample estimates is approximately equal to the square root of the sum of the squared standard errors of the estimates. The standard error (se) of the difference between sample estimate " $a$ " and sample estimate " $b$ " (if "a" and " $b$ " are approximately independent) is:

$$
s \theta_{a-b^{-}} \sqrt{s_{a}^{2}+s_{b}^{2}}
$$

It should be noted that most of the standard errors presented in the indicators and in the original documents are approximations. That is, to derive estimates of standard errors that would be applicable to a wide variety of items and that could be prepared at a moderate cost, a number of approximations were required. As a result, most of the standard errors presented provide a general order of magnitude rather than the exact standard error for any specific item.

Both universe and sample surveys are subject to nonsampling errors. Nonsampling errors can arise in various ways: from respondents or interviewers interpreting questions differently, from respondents estimatir, the values that they provide, from partial or total nonresponse, from imputation or reweighting to adjust for nonresponse, from inability or unwillingness on the part of respondents to provide correct information, from recording and keying errors, or from overcoverage or undercoverage of the target universe.

Sampling and nonsampling error combine to yield total survey error. Since estimating the magnitude of nonsampling errors would require special experiments or access to independent data, these magnitudes are seldom available. In almost

## Sources of Data

all situations, the sampling eıor represents an understatement of the total survey error, and thus an overstatement of the pricision of the survey estimates.

To compensate for suspected nonrandom errors, adjustments of the sample estimates are often made. For example, adjustments are frequently made for nonresponse, both iotal and partial. An adjustment made for either type of nonresponse is often , eferred to as an imputation-for example, substitution of the "average" questionnaire response for the nonresponse. Imputations are usually made separately within various groups of sample members which have similar survey characteristics. Imputation for item nonresponse is often made by substituting for a missing item the response to that item of a respondent having characteristics that are similar to those of the nonrespondent.

## Current Population Survey

Current estimates of school enrollment and social and economic characteristics of students are based on data collected in the Census Bureau's monthly household survey of about 60,000 households, Current Population Survey (CPS). The CPS consists of 729 samples areas comprising 1,973 counties, independent cities, and minor civil divisions throughout the 50 siates and the District of Columbia. The current sample was selected from 1980 census files and is periodically updated to reflect new housing construction.

The primary function of the monthly CPS is to collect data on labor force participation $c^{5}$ ? the civilian noninstitutional population (it excludes military personnel and inmates of institutions). Ir, October of each year questions on school enrollment by grade and other school characteristics are asked about each member of the household. A report on the educational attainment of the population is produced from data gathered in March of each year when supplemental questions on income are asked.

The estimation procedure employed for the monthly CPS data involves inflating weighted sample results to independent estimates for the total civilian noninstitutional population by age, sex, race, and ilispanic origin. These independent estimates are derived from statistics from decennial censuses of the population: statistics on births, deaths, and immigration and emigration: and statistics on the strength of the Armed Foices. Generalized standard error tables are provided in the Current Population Reports. The data are subject to both nonsampling and sampling errors.

Further information is available in the Current Population Reports, Series P-20, or by contacting:

Education and Social Stratification Branch

Washington, DC 20233

School Enrollment. Each October, the Current Population Survey (CPS) includes supplemental questions on the enrollment status of the population aged 3 years old and over. Annual reports documenting school enrollment of the population have been produced by the Bureau of the Census since 1946. The latest report is Current Population Reports, Series P-20, No. 443, "School Enrollment--Social and Economic Characteristics of Students: October 1988 and 1987." All sample surveys are subject to sampling and nonsampling error. The main sources of nonsampling error in the supplement are those inherent in any household survey. When a household respondent reports for all individuals in the household, is that person knowledgeable about the grade or level of school, type of school, or full-time status? In addition, some analysts believa socia! acceptability of response causes biased reporting, such as reluctance to report lack of a high school diploma; some dismiss it. Household-reported data may not be consistent with administrative data because definitions may not be the same. An additional source of variation in statistics reported may be a change in the survey universe over time. For example, a significantly larger proportion of young men were members of the Armed Forces in the late 1960s and early 1970s, than before or after and, therefore, were not in the SPS universe. That caused a short term increase in the enrollment rate of young men, which wias greater than the in: rease in numbers of enrollees would indicate. Other events may similarly affect survey data. The user must be mindful of external events as well as the character of the population being measured when describing survey trends.

An advantage of huusehold survey data over administrative data is the availability of demographic, social and economic data for the student and family, not available in administrative data. Beginning with data for October 1981, tabulations have been controlled to the 1980 census. Estimates for earlier years were controlled to earlier censuses.

U.S. Department of Commerce

Washington, DC 20233

Educational Attainment. Data on years of school completed are derived from two questions on the Current Population Survey (CPS) instrument. Biennial reports documenting educational attainment are produced by the Bureau of the Census
using March CPS data. The latest report is Current Population Reports, Series P-20, No. 428 "Educational Attainment in the United States, March 1987 and 1986."

The ustial constraints on use of household survey data apply. Reliability of response may depend on whether a proxy respondent was used, the recency and importance of the event, and the number and clarity of response categories. There is some evidence that years of school completed in the CPS may not measure completion of degrees as clearly as they once did. The number of persons who have completed 4 years of college has been increasing more rapidly than the number of bachelor's degrees added each year would suggest. While the number of years completed is not deteriorating in quality (that is, respondents are not exaggerating the number of years), more students than in the past are taking more than 4 academic years to complete a bachelor's degree. Also, although interviewers are instructed to count receiving a high school diploma by means of passing a GED exam as completion of the 12th grade, as the number of persons who have received a diploma in this way has increased the number counted appropriately may not have kept pace. The 1990 Census of Population will contain a question on highest degree received rather than relying solely on a years of school completed item.

Begi nning with the data for March 1980, tabulations have been controlled to the 1980 cerisus. Estimates for earlier years were controlled to earlier censuses.

## Integrated Posisecondary Eáucation Data System

The Integrated Postsecondary Education Data System (IPEDS) surveys all postsecondary institutions, including universities and colleges as well as institutions offering technical and vocational education beyond the high school level. This suivey, which began in 1986, will both replace and supplement the previous one, the Higher Education General Information Survey (HEGIS). For a full description of the various programs contained in IPEDS, therofore, the reader is referred to a discussion of the various HEGIS programs ontlined below. What follows in this section is a brief overview of the IPEDS program.

The IPEDS consists of several integrated components that obtain information on who provides postsecondary education (institutions), who participates in it and completes it (studerits), what programs are offered and wha! programs are completed, and the resources involved in the provision of institutionally based postsecondary education, both human resources and financial resources. Specitically, these components include: institutional characteristics including institutional activity; fall enrollment, including age and residence; fall enrollment in occupationally specific programs; completions; finance; staff; salaries of full-time instructic.nal faculty; and academic libraries.

The higher education portion of this survey is a census of all education institutions. However, data from the other technical ard vocational institutions are collected through a sample survey. Thus, some portions of the tlata will be subject to sampling and nonsampling errors, while some portions will be subject only to nonsampling errors. The tabulations on institutional characteristics developed for this edition of the Condition are based on lists of all institutions and are not subject to sampling errors.

Further information on IPEDS may be obtained from:

## Higher Education General Information Sur'sy

The "Higher Education General Information Survey" (HEGIS) was a coordinated effort administered by NCES which acquired and maintained statistical data on the characteristics ano nderations of institutions of higher education. Implemented in 1966. HEGIS was an annual universe survey of institutions listed in the latest NCES Education Directory, Colleges and Universities. It has since been replaced by the Integrated Postsecondary Education Data System (see above).

The information presented in this report drew on HEGIS surveys which solicited information concerning institutional characteristics, faculty salaries, finances, enrollment, and degrees. Since these surveys were distributed to all higher education institutions, the data presented were not subject to sampling error. However they were subject to nonsampling error, the sources of which varied with the survey instrument. Each survey is therefore discussed separately. Information concerning the nonsampling error of the enrolliment and degrees surveys draws extensively on the "HEGIS Post-Survey Validation Study" conducted in 1979.

Institutional Characteristics of Colleges and Universities. This survey provided the basis for the universe of institutions presented in the Education Directory, Colleges and Universities, and it was used in all other HEGIS data collection activities. The universe comprised institutions that offer at least a 1 -year program of college-level studies leading toward a degree and that met certain accreditation criteria. In the fall, institutions included in the Directory the previous year received a computer printout of their information to update. All institutions reporter were certified as eligible to be listed by the Division of Eligibility and Agency Evaluation within the U.S. Department of Education.

Opening Fall Enrollment in Colleges and Universities. This survey was part of the HEGIS series since its development. The enrollment survey response rate was relatively high; the 1985 response rate was 92 percent. Major sources of nonsampling error for this survey were classification problems, the unavailability of needed data, interpretation of definitions, the survey due date, and operational errors. Of these, the classification of students appears to have been the main source of error. Institutions had problems in correctly classifying first-time freshmen, other first-time students, and unclassified students for both full-time and part-time

## Sources of Data

categories. These problems occurred most often at 2-year insu tions (both privale and public) and private 4 -year institutions. In 1977-78, the classification problem led to an estimated overcount of 11,000 full-time students and an undercount of 19,000 part-time students. Although the ratio of error to the grand total was quite small (less than 1 percent), the percentage of errors was as high as 5 percent for detailed student levels and even higher at certain disaggregated levels.

Beginning with fall 1986, the survey system was redesigned with the introduction of the Integrated Postsecondary Education Data System (IPEDS) (see above). The neiv survey system comprises all postsecondary institutions, but also maintains comparability with earlier surveys by allowing HEGIS institutions to be tabulated separately. The new system also provides for preliminary and revised data releases. This allows the Center flexibility to release early data sets while still maintaining a more accurate final data base.

Salaries, Tenure, and Fringe Benefits of Full-Time Instructional Faculty. This survey has been conducted for most years from 1966-67 to 1987-88. Although the survey form was changed a number of times during those years, only comparable data are presented in this report. The data were collected from the individua! colleges and universities.

Until 1987, this survey differed from other HEGIS surveys in that imputations were not made for nonrespondents. Thus, there is greater possibility that the salary averages presented in this report may differ from the results of a complete enumeration of all colleges and universities. The response rate for the 1984-85 survey was 86.3 percent. The response rate for public colleges was substantially higher than the response rate for private colleges. It is probable that the public colleges' salary data were more accurate than the data for private colleges. Other sources of nonsampling error included computational errors and misclassification in reporting and processing. NCES checked individual colleges' data for internal and longitudinal consistency and contacted the colleges to check inconsistent data.

Earned Degrees Conferred. This survey was part of the HEGIS series throughout its existence. However, the degree classification taxonomy was revised in 1970-71 and 1982-83. Though information from survey years 1970-71 through 1981-82 is directly comparable, care must be taken if information before or afte" " . period is included in any comparison. Degrees-conferred trend tables aria sud by the 1982-83 classification were added to the Condition to provide consistent data from 1970-71 to 1983-84. Data in this edition on associate and other formal awards below the baccalaureate, by field of study, are not comparable with figures for earlier years. The nonresponse did not appear to be a significant source of nonsampling error for this survey. The return rate over the years was extremely high, with the
respunse rate for the 1983-84 survey at 05 percent. Because of the high return rate, nonsampling error caused by imputation was also minimal.

The major sources of nonsampling error for this survey were differences between the HEGIS program taxonomy and taxonomies used by the colleges, classification of double majors and double degrees, operational problems, and survey timing. In the 1979 validation study, these sources of nonsampling error were found to contribute to an error rate of 0.3 percent overreporting of bachelor's degrees and 1.3 percent overreporting of master's degrees. The differences, however, varied greatly among fields. Over 50 percent of the fields selected for the validation study had no errors identified. Categories of fields that had large differences were business and management, education, engineering, letters, and psychology. It was also shown that differences in proportion to the published figures were less than 1 percent for most of the selected fields that had some errors. Exceptions to these were: master's and Ph.D. programs in labor and industrial relations ( 20 percent and 8 percent); bachelors's and master's programs in art education (3 percent and 4 percent); bachelor's and Ph.D. programs in business and commerce, and in distributive education ( 5 percent and 9 percent); master's programs in philosophy ( 8 percent); and Ph.D. progranis in psychology ( 11 percent).

Beginning with the 1986-87 academic year, the IPEDS completions survey repiaced the HEGIS Earned Degrees Conferred survey.

Financial Statistics of Institutions of Higher Education. This survey was part of the HEGIS series throughout its $9 x i s t e n c e$. A number of changes were made in the financial survey instruments in 1975. In 1982 another change was made to include Pell Grants in federal resi.icted grants and contracts revenues and restricted scholarships and fellowships expenditures. While these changes were significant, only comparable information on trends is presented in this report, except where noted. Finance tables for this publication have been adjusted by subtracting the Pell Grant amounts from the later data to maintain comparabiity with pre-1982 data.

Other possible sources of nonsampling error in the financial statistics were nonresponse, imputation, and misclassification. The response rate has been over 90 percent for most of the years reported. The response rate for the latest (fiscal year 1985) survey was 87.6 percent.

Two general methods of imputation were used. If the prior year's data were available for a nonresponding institution, these data were inflated using the Higher Education Price Index and adjusted according to changes in enrollments. If no previous year's data were available, current data were used from peer institutions selected for location (state or region), control, level, and enrollment size of institution.

For the most recent years reported, the imputation method did not include the adjustment for changes in enrollments, and new institutions which never reported to HEGIS surveys were not imputed. For the fiscal year 1985 survey, survey forms were mailed to 3,379 institutions. Reports were received from 2,959 institutions, and data for 370 institutions were estimated based on their fiscal year 1984 reports inflated by the Higher Education Price Index. The remaining 50 institutions were not imputed because they had never responded to HEGIS surveys. The imsuted current-fund expenditures of the nonrespondents were generally less than 3 percent of the aggregate U.S. total.

To reduce reporting error, NCES used national standards for reporting finance statistics. These standards are contained in Colleges and University Business Administration: Administrative Services (1974 Edition), published by the National Association of College and University Business Officers; Audits of Colleges and Universities (as amended August 31, 1974), by the American Institute of Certified Public Accountants; and HEGIS Financial Reporting Guide (1980), by NCES. Wherever possible, definitions and formats in the survey form are consistent with those in these three accounting references.

Questions concerning the surveys used as data sources for this report or other questions concerning HEGIS can be directed to:

## National Postsecondary Student Aid Study

The National Center for Education Statistics conducted the National Postsecondary Student Aid Study (NPSAS) for the first time during the 1986-87 school year. This survey established the first comprehensive student financial aid data base. r'ata were gathered from 1,074 postsecondary institutions and approximately 80,000 students and 24,000 parents. These data provided information on the cost of postsecondary education, the distribution of financial aid, and characteristics of both aided and non-aided students and their families. The survey also provided data on the distribution of financial aid, the nature of aid packages, and a profile of both aided and non-aided students.

In response to the continuing need for these data, NCES conducted the second cycle of NPSAS for the 1989-90 school year. In addition to replicating the earlier
study, the 1990 NPSAS contains enhancements to the 1987 methodology that will fully meet the data needs of the financial aid community and of policymakers.

The 1990 in-school sample involved about 70,000 students selected from registrar lists of enrollees at 1,200 postsecondary institutions. The sample will include both aided and non-aided students. Student information such as field of study, education level and attendance status (part-time or full-time) will be obtained from registrar records. Types and amounts if financial aid and family financial characteristics will be abstracted from school fina' icial aid records. Also, approximately 26,000 parents of students will be sampled. Data concerning family composition and parent financial characteristics will be compiled. Followup data collections are expected at 2 -year intervals. Students enrolled in postsecondary education for the first time in 1990 will serve as the base for the longitudinal component of NPSAS.

Further information about this survey may be obtained from:

## Survey of Recent College Graduates

NCES has conducted periodic surveys of persons, about 1 year after graduation, to collect information on college outcomes. The "Recent College Graduates" surveys have concentrated on those graduates entering the teaching profession. To obtain accurate results on this subgroup, graduates who are newly qualified to teach have been oversampled in each of the surveys. The survey involves a two-stage sampling procedure. First, a sample of institutions awarding bachelor's and master's degrees is selected and stratified by percentage of education graduates, control, and type of institution. Second, for each of the selected institutions, a sample of degree recipients is chosen. The response rates on the recent college graduates survey have tended to be low because of the great difficulty in tracing the students after graduation. Much more of the nonresponse can be attributed to invalid mailing addresses than to refusals to participate. Despite their shortcomings, the data are presented in this report because they provide valuable information not available elsewhere about college outcomes. Users should be cautious about drawing conclusions based on data from small samples. It is also likely that the data are somewhat biased since the more mobile students, such as graduate students, are the most difficult to track for the survey.

The 1976 survey of 1974-75 college graduates was the first and smallest of the series. The sample consisted of 209 schools, of which 200 ( 96 percent) responded. Of the 5,506 graduates in the sample, 4,350 responded, for a response rate of 79 percent.

The 1981 survey was somewhat larger, with a coverage of 301 institutions and 15,852 graduates. Responses were obtained from 286 institutions, for an institutional response rate of 95 percent, and irom 9,312 graduates (716 others were determined to be out of scope), for a response rate of 62 percent.

The 1985 survey requested data from 18,738 graduates from 404 colleges. Responses were obtained from 13,200 students, for a response rate of 74 percent ( 885 were out of scope). The response rate for the colleges was 98 percent. The 1987 survey form was sent to 21,957 graduates. Responses were received from 16,878 , for a response rate of 79.7 percent.

## National Survey of Posisecondary Fáculty (NSOPF-88)

The National Survey of Postsecondary Faculty is a comprehersive survey of higher education instructional faculty in the fall of 1987. It was the first such survey conducted since 1963. It gathsred information regarding the backgrounds, responsibilities, workioads, salaries, benefits, and attitudes cf both full- and part-time instructional faculty in 2-arid 4 -year institutions under both public and private control. In addition, information was gathered from institutional and department-level respondents on such issues as faculty composition, new hires, departures and recruitment, retention, and tenure policies.
. here were three major components of the study: a survey of institutional-level respondents at a stratified random sample of 480 U.S. colleges and universities; a survey of a stratified random sample of 3,029 eligible department chairpersons (or their equivalent) within the participating 4 -year institutions; and a survey of a stratified random sample of 11,013 eligible faculty members withri ide varticipating
institutions. Response rates to the three surveys were 88 percent, 80 percent, and 76 perivent, respectively.

The universe of inctitutiors fism which the sample was selected was all accredited nonproprietary U.S. postsecondary institutions that grant a 2 -year (A.A.) or higher degree and whose accreditation at the higher education level is recognized by the U.S. Department of Education. This includes religious, medical, and other specialized postsecondary institutions as well as 2 - and 4 -year nonspecialized institutions. According to the 1987 Integrated Postsecondary Education Data System (IPEDS), this universe comprised 3,159 institutions. The universe does not include proprietary 2-and 4 -year institutions or less than 2-year postsecondary institutions.

Further information about this survey may be obtained from:

Linda Zimbler<br>Postsecondary Education Statistics Division<br>National Center for Education Statistics<br>555 New Jersey Avenue NW<br>Washington, DC 20208-5652<br>\section*{High School and Beyond}

High School and Beyond (HS\&B) is a national longitudinal survey of 1980 high school sophomores and seniors. The base-year surves was a probability sample of 1,015 high schools with a target number of 36 sophomores and 36 seniors in each of the schools. A total of 58,270 students participated in the base-year survey. Substitutions were made for noncooperating schools-but not for students-in those strata where it was possible. Overall, 1,122 schools were selected in the original sample and 811 of these schools participated in the survey. An additional 204 schools were drawn in a replacement sample. Student refusals and student absences resulted in an 82 percent completion rate for the survey.

Several small groups in the population were oversampled to allow for special study of certain iypes of schools and students. Students completed questionnaires and took a battery of cognitive tests. In adidition, a sample of parents of sophomores and seniors (about 3,600 for each cohort) was surveyed.

HS\&B first followup activities took place in the spring of 1982. The sample design of the first followup survey called for the selection of approximately 30,000 people who were sophomores in 1980. The completion rate for sophomores eligible for on-campus survey administration was about 96 percent. About 89 percent of the students who left school between the base year and first followup surveys (dropouts,
transfer students, and early graduates) completed the first followup sophomore questionnaire.

As part of the first followup survey of High School and Beyond, transcripts were requested in fall 1982 for an 18,152-member subsample of the sophomore cohort. Of the 15,941 transcripts actually obtained, 1,969 were excluded because the students had dropped out of school betore graduation, 799 were excluded because they were incomplete, and 1,057 were excluded because the student graduated before 1982 or the transcript indicated neither a dropout status nor graduation. Thus 12,116 transcripts were used for the overall curriculum analysis presented in this publication. All courses in each transcript were assigned a six-digit code based on A Classification of Secondary School Courses (developed by Evaluation Technologies, Inc., under contract with NCES). Credits eatıed in each course were expressed in Carnegie units. (The Cariegie unit is a standard of measurement that :epresents one credit for the completion of a 1 -year course. To receive credit for a course, the student must have received a passing grade-"pass," "D," or higher.) Students who transferred from public to private schools or from private to public schools between their sophomore and senior years were eliminated from public/private analyses.

In designing the senior cohort first followup survey, one of the goals was to reduce the size of the retained sample, while still keeping sufficient numbers of minorities to allow important policy analyses. A total of 11,227 (94 percent) of the 11,995 persons subsampled completed the questionriaire. Information was obtained about the respondents' school e.nd employment experiences, family status, and attitudes and plans.

The sample for the seccnd followup, which took place in spring 1984, consisted of about 12,000 members of the senior cohort and about 15,000 members of the sophomore cohort. The completion rate for the senior cohort was 91 percent, and the completion rate for the sophomore cohort was 92 percent.

HS\&B third followup data collection activities were performed in spring 1986. Both the sophomore and senior cohort samples for this round of data collection were the same as those used for the second followup survey. The completion rates for the sophomore and senior cohort samples were 91 percent and 88 percent, respectively.

An NCES series of technical reports and data file user manuals provides additional information on the survey methodology.

Washington, DC 20208-5653

## National Longitudinal Study

The National Longitudinal Study (NLS) of the high school class of 1972 began with the collection of base-year survey data from a sample of about 19,000 high school seniors in spring of 1972. Five more followup surveys of these students were conducted in 1973, 1974, 1976, 1979, and 1986. The NLS was designed to provide the education community with information on the transitions of young adults from high school through postsecondary education and the workplace.

The sample design for the NLS is a stratified, two-stage probability sample of students from all schools, public and private, in the 50 states and the District of Columbia with a 12 th-grade enrollment during the 1971-72 school year. During the first stage of sampling, about 1,070 schools were selected for participation in the base-year survey. As many as 18 students were selected at random from each of the sample schools. The sizes of the school and student samples were increased during the first followup survey. Beginning with the first followup and continuing through the fourth followup, about 1,300 schools participated in the survey, and slightly under 23,500 students were sampled. The response rates for each of the different rounds of data collection have been 80 percent or higher.

Sample retention rates across the survey years have been quite high. For example, of the individuals responding to the base-year questionnaire, the percentages who responded to the first, second, third, and fourth followup questionnaires were about 94, 93, 89, and 83 percent, respectively.

## National Science Foundation

## Survey of Earned Doctcrates

The Survey of Earned Doctorates (SED) has been conducted annually by the National Research Council, under contract, for the U.S. Department of Education, the National Endowment for the Humanities, the National Science Foundation, and other federal agencies since 1957. Information from the survey becomes part of the Doctorate Records File, which includes records for doctorates awarded since 1920 by regionally accredited universities and colleges. The universe consists of all recipients of doctoral degrees such as Ph.D. or D.Sc., but excludes the recipients of first-professional degrees such as the J.D. or M.D. Approximately 95 percent of the annual cohort of doctorate recipients have responded to the questionnaire which is distributed through the cooperation of the Graduate Deans. Partial data from public sources are added to the file for nonrespondents. The data for a given year include all doctorates awarded in the 12 -month period ending on June 30 of that year.

Data for the SED are collected directly from individual doctorate recipients. In addition to the field and specialty of the degree, the recipient is asked to provide educational history, selected demographic data, and information on postgraduate work and study plans. The National Center for Education Statistics' "Survey of Earned Degrees," part of its Higher Education General Information Survey (HEGIS), collects data from institutions, not individuals. Therefore, the number of doctorates reported in SED differs slightly from HEGIS totals. Also, SED data are restricted ${ }^{\circ} \mathrm{o}$ research doctorates.

The differences between the two data series have been generally consistent since 1960. The ratio of NCES/SED totals for all Ph.D.s has ranged from 1.01 to 1.06 .

Further information on this survey can be obtained from Summary Report: Doctorate Recipients from United States Universities, various years, published by the National Research Council, or by contacting:

Office of Scientific and Engineering Personnel
National Research Council
2101 Constitution Avenue NW
Washington, DC 20418

## Survey of Doctorate Recipients

The Survey of Doctorate Recipients (SDR) is a biennial survey of individuals who have received doctorates in the humanities, sciences, and engineering over the past four decades. It has surveyed scientists, including social scientists and psychologists, and engineers since 1973 and humanists since 1977. It is conducted by the National Research Council with support from the National Science Foundation, the National Endowment for the Humanities, the National Institutes of Health, the Department of Agriculture, and the Department of Energy.

The population for the survey consists of indiviciuals who have received doctorates during a 42 -year period. To maintain the length of this timespan for each biennial survey, the two most recent graduating cohorts of Ph.D.s are added to the population, and the two oldest are eliminated. It is a longitudinal survey-that is, individual members of the survey panel are resurveyed every 2 years-and contains historical data on employment status, employment sector, primary work activity, academic rank, tenure status, salary, and other characteristics.

For a more detailed discussion of the history of the SDR, the sample, and other methodological issues, see: National Research Council, Methodological Report of the 1987 Survey of Doctorate Recipients, National Research Council, April 1989 (prepared by Mary Belisle).

Washington, DC 20418

## Scientific and Engineering Expenditures at Universities and Colleges Survey

The National Science Foundation's Survey of Scientiiic and Engineering Expenditures at Universities and Culleges orginated in 1954 and has been conducted annually since 1972. The population surveyed in most years has consisted of the $55^{\prime}$ - to 600 universities and colleges that grant a graduate science or engineering degree and/or annually perform at least $\$ 50,000$ in separately budgeted research and development (R\&D), defined as current fund expenditures designed to produce specific research outcomes and funded either by an external agency to an institution or separately budgeted by an internal institution unit. The

## Sources of Data

institutions included in this survey population expend over 95 percent of the nation's academic R\&D funds. In addition, approximately 17 university administered federally funded research and development centers (FFRDCs) that are engaged in basic or applied research, de' .Jpment, or management of R\&D activities are surveyed.

Since 1984 this survey has been conducted as a sample survey consisting of two strata: a certainty stratum including all doctorate-granting institutions, all historically black colleges and universities with R\&D, and all university administered FFRDCs; and a probability stratum including a random sample of all nondoctorate-granting institutioris that perform significant levels of research and development.

Further information on this survey may be obtained from Guide to the National Science Foundation's Surveys of Academic Science and Engineering, December 1990, published by the National Science Foundation, or by contacting

Science and Engineering Activities Program Division of Science Resources Studies
National Science Foundation, Room L-611
Washington, DC 20550

## 2. Private Research and Professional Associations

## Graduate Record Examination Council

All students who have taken the Graduate Record Exami ations (GRE) General Test were asked a series of background information questions. These responses and the test scores themselves form the basis for continuing GRE Program research. In addition, these data are compiled and included in an annual report. The 12th in the series is A Summary of Data Collected From Graduate Record Examinations Test Takers During 1986-1987.

The GRE cautions users of these data that "information in these reports is based solely on examinees who took the Graduate Record Examination (GRE) General Test and should not be interpreted as being representative of any other group. The report does not present data for all baccalaureate degree recipients, for all graduate school applicants, or for all first-time graduate school enrollees." Nevertheless, the test-taking group is a large subset (albeit a self-selected one) of each of these groups.

Further information on this and previous editions of the report may be obtained by contacting:

Office of the GRE Program Director
Educational Testing Service
Princeton, NJ 08541

## C. Glossary

Academic support: This category of college expenditures includes expenditures for support services that are an integral part of the institution's primary missions of instruction, research, or public service. Includes expenditures for libraries, galleries, audio/visual services, academic computing support, ancillary support, academic administration, personnel development, and course and curriculum development.

Appropriation (institutional revenues): An amount (other than a grant or contract) received from or made available to an institution through an act of a legislative body.

Associate degree: A degree granted for the successful completion of a sub-baccalaureate program of studies, usually requiring at least 2 years (or equivalent) of full-time college-level study. This includes degrees granted in a cooperative or workstudy program.

Auxiliary enterprises: This category includes those essentially self-supporiing operations which exist to furnish a service to students, faculty, or staff, and which charge a fee that is directly related to, although not necessarily equal to, the cost of the service. Examples are residence halls, food services, college stores, and intercollegiate athletics.

## Baccalaureate degree: See Bachelor's degree.

Bachelor's degree: A degree granted for the successful completion of a baccalaureate program of studies, usually requiring at least 4 years (or equivalent) of full-time college-level study This includes degrees granted in a cooperative or work/study program.

Cohort: A group of individuals who have a statistical factor in common, for example, year oí birth.

College: A postsecondary school which offers general or liberal arts education, usually leading to an associate, bachelor's, master's, doctor's, or first professional degree. Junior colleges and community colleges are included under this terminology.

Constant dollars: Dollar amounts that have been adjusted by means of price and cost indexes to eliminate inflationary factors and allow direct comparison across years.

Control of institutions: A ciassification of institutions of higher education by whether the institution is operated by publicly elected or appointed officials (public control) or by privately elected or appointed officials and derives its major source of funds from private sources (private control).

Consumer price Index (CPI): This price index measures the average change in the cost of a fixed market basket of goods and services purchased by consumers.

Current dollars: Dollar arnounts that have not been adjusted to compensate for inflation.

Current-fund expenditures (higher education): Money spent to meet current operating costs, including salaries, wages, utilities, student services, public services, research libraries, scholarships and fellowships, auxilia:y enterprises, hospitals, and independent operations. Excludes loans, capital expenditures, and investments.

Current-fund revenues (higher education): Money received during the current fiscal year from revenue which can be used to pay obligations currently due, and surpluses reappropriated for the current fiscal year.

Dependent student: A student who under federal criteria is considered to be financially dependent on her or his parents or guardians. Most students are considered dependent until they are 24 years old.

Doctor's degree: An earned degree carrying the title of Doctor. The Doctor of Philosophy degree (Fh.D.) is the highest academic degree and requires mastery within a field of knowledge and demonstrated ability to perform scholarly research. Other doctorates are awarded for fulfilling specialized requirements in professional fields, such as education (Ed.D.) musical arts (D.M..A.), business administration (D.B.A.), and engineering (D.Eng. or D.E.S.). Many doctor's degrees in both academic and professional fields require an earned master's degree as a prerequisite. First-professional degrees, such as M.D. and D.D.S., are not included under this heading.

Educational attainment: The highest grade of regular school attended and completed.

Educational and general exp nditures: The sum of current funds expenditures on instruction, research, public service. academic support, student services, institutional support, operation and maintenance of plant, and awards from restricted and unrestricted funds.

Enrollment: The total number of students registered in a given school unit at a given time, generally in the fall of a year.

Expected family contribution (EFC). The amount that a family is expected to pay toward meeting postsecondary costs of attendance (students and parents of dependent students are both expected to make contributions.) This amount is determined through an analysis of need (for example, the Congressional Methodology) and is based on taxable and nontaxable income and assets as well as family size, the number of family members attending postsecondary institutions, extraordinary medical expenses, and so forth. For dependent students, the EFC consists of both a parental contribution and a separately calculated student contribution. The minimum student contribution in 1988-89 was $\$ 700$ for freshmen and $\$ 900$ for other undergraduates.

Expenditures: Charges incurred, whether paid or unpaid, which are presumed to benefit the current fiscal year. For elementary/secondary schools, these include all charges for current outlays plus capital outlays and interest on school debt. For institutions of higher education, these include current outlays plus capital outlays. For government, these include charges net of recoveries and other correcting transactions other than for retirement of debt, investment in securities, extension of credit, or as agency transaction. Government expenditures include only external transactions, such as the provision of perquisites or other payments in kind. Aggregates for groups of governments exclude intergovernmental transactions among the governments.

Expenditures per pupil: Charges incurred for a particular period of time divided by a student unit of measure, such as fall enrollment or full-time-equivalent enrollrnent.

Federal aid: Student financial aid whose source is the federal government. This aid can either be provided by or administered by a federal agency. Federal agencies providing aid include the Department of Education, Department of Health and Human Services, Department of Defense, Veterans Administration, and the National Science Foundation. Federal aid can be in the form of grants, loans, and work-study aid.

First-professional degree: A degree that signifies both completion of the academic requirements for beginning practice in a given profession and a level of professional skill beyond that normally required for a bachelor's degree. This degree usually is based on a program requiring at least 2 academic years of work prior to entrance and a total of at least 6 academic years of work to complete the degree program, including both prior-required college work and the professional program itself. By NCES definition, first-professional degrees are awarded in the fields of dentistry
(D.D.S or D.M.D.), medicine (M.D.), opiometry (O.D.), osteopathic medicine (D.O.), pharmacy (D.Phar.), podiatric medicine (D.P.M.), veterinary medicine (D.V.M.), chiropractic (D.C. or D.C.M.), law (J.D.), and theological professions (M.Div. or M.H.L.).

Fiscal year: The yearly acrounting period for the federal government, which begins on October 1 and ends on the following September 30. The fiscal year is designated by the calendar year in which it ends; e.g., fiscal year 1988 begins on October 1, 1987, and ends on September 30, 1988. (From fiscal year 1844 to fiscal year 1976 the fiscal year began on July 1 and ended on the following June 30.)

Foreign student: See Nonresident alien.
Full-time-equivalent (FTE) enrollment: For institutions of higher education, enrollment of full-time students, plus the full-time equivalent of part-time students as reported by institutions. In the absence of an equivalent reported by an institution, the FTE enrollment is estimated by adding one-third of part-time enrollment to full-time enrollment.

Full-time instructional faculty: Those members of the instruction/research staff who are employed full-time as defined by the institution, including faculty with released time for research and faculty on sabbatical leave. Full-time counts exclude faculty who are employed to teach less than two semesters, three quarters, two trimesters, or two 4-month sessions; replacements for faculty on sabbatical leave or those on leave without pay; faculty for preclinical and clinical medicine; faculty who are donating their services; faculty who are members of military organizations and paid on a different pay scale from civilian employees; academic officers, whose primary duties are administrative; and graduate students who assist in the instruction of courses.

Full-time enrollment: The number of students enrolled in higher education courses with total credit load equal to at least 75 percent of the normal full-time course load.

Full-time worker: A worker who usually works 35 or more hours per week. In educational institutions, an employee whose position requires being on the job on school days throughout the school year at least the number of hours the schools are in session. For higher education, a member of an educational institution's staff who is employed full-time.

General educational development (GED) test: A test administered by the American Council on Education as the basis for awarding a high school equivalent certification.

Government appropriation: An amount (other than a grant or contract) received from or made available to an institution through an act of a legislative body.

Government grant or contract: Revenues from a government agency for a specific research project or other program.

Graduate enrollment: The number of students who hold the bachelor's or first-professional degree, or the equivalent, and who are working towards a master's or doctor's degree. First-professional students are counted separately. These enrollment data measure those students who are registered at a particular time during the fall. At some institutions, graduate enrollment also includes students who are in postbaccalaureate classes but not in degree programs.

Graduate record examination (GRE): Multiple-choice examinations administered by the Educational Testing Service and taken by applicants who are intending to attend certain graduate schools. Two generalized tests are offered, plus specialized tests in a variety of subjects areas. Ordinarily, a student will take only the specialized test that applies to the intended field of study.

Graduate student: A student who holds a bachelor's or first-professional degree, or equivalent, and is taking courses at the post-baccalaureate level. These students may or may not be enrolled in graduate programs.

Grant: Also known as scholarships, these are funds for postsecondary education that do not have to be repaid.

Gross domestic product (GDP): Gross national product less net property income from abroad. Both gross national product and gross domestic product aggregate only the incomes of residents of the Nation, corporate and individual, deriving directly from the current production of goods and services. However, gross national produci also includes net property income from abroad. See also Gross national product.

Gross natlonal product (GNP): A measure of the money value of the goods and services becoming available to the Nation from economic activity. GNP can be viewed in terms of expenditure categories which include purchases of goods and services by consumers and government, gross private domestic investment, and net exports of goods and services. The goods and services included are largely those bought for final use (excluding illegal transactions) in the market economy. A number of inclusions, however, represent imputed values, the most important of which is rental value of owner-occupied housing. GNP, in this broad context, measures the output attributable to the factors of production-labor and property-supplied by U.S. residents.

Higher education: Study beyond secondary school at an institution that offers programs terminating in an associate, baccalaureate, or higher degree.

Higher education institutions (general definition): Institutions providing education above the instructional level of the secondary schools, usually beginning with grade 13. Typically, these institutions include collages, universities, graduate schools, professional schools, and other degree-granting institutions.

Independent operations: A group of self-supporting activities under control of a college or university. For purposes of financial surveys conducted by the National Center for Education Statistics, this category is composed principally of federally funded research and development centers (FFRDC).

Inflation: An upward movement in general price levels that results in a decline of purchasing power.

Institutional support: The category of higher education expenditures that includes day-to-day operational support for colleges, excluding expenditures for physical plant operations. Examples of institutional support include general administrative services, executive direction and planning, legal and fiscal operations, and community relations.

Instruction: That category incluaing expenditures of the colleges, schools, departments, and other instructional divisions of higher education institutions, and expenditures for departmental research and public service which are not separately budgeted. Includes expenditures for both credit and noncredit activities. Excludes expenditures for academic administration where the primary function is administration (e.g., academic deans).

Labor force: Persons employed as civilians, unemployed, or in the armed services during the survey week. The "civilian labor force" comprises all civilians classified as employed or unemployed.

Loan: Borrowed money that must be repaid.
Mandatory transfer: A transfer of current funds that must be made in order to fulfill a binding legal obligation of the institution. Included under mandatory transfers are debt service provisions relating to academic and administrative buildings, including (1) amounts set aside for debt retirement and interest and (2) required provisions for renewal arid replacement of buildings to the extent these are not financed from other funds.

Master's degree: A degree awardea for successful completion of a program generally requiring 1 or 2 years of full-time college-level study beyond the bachelor's degree. One type of master's degree including the Master of Arts degree, or M.A., and the Master of Science degree, or M.S., is awarded in the liberal arts and sciences for advanced scholarship in a subject field or discipline arid demonstrated ability to perform scholarly research. A second type of master's degree is awarded for the completion of a professionally oriented program, for example, an M.Ed. in education, an M.B.A. in business administration, an M.F.A. in fine arts, an M.M. in music, an M.S.W. in social work, and an M.P.A. in public administration. A third type of master's degree is awarded in professional fields for study beyond the first-professional degree, for example, the Master of Laws (LL.M.) and Master of Science in various medical specializations.

Nonresident alien: A person who is not a citizen of the United States and who is in this country on a temporary basis and does not have the right to remain indefinitely.

Part-time enrollment: The number of students enrolled in higher education courses with a total credit load less than 75 percent of the normal full-tirne credit load.

Personal income: Current income received by persons from all sources minus their personal contributions for social insurance. Classified as "persons" are individuals (including owners of unincorporated firms), nomprofit institutions serving individuals, private trust funds, and private noninsured welfare funcis. Personal income includes transiers (payments not resulting from current production) from government and business such as social security beriefits, military pensions, etc., but excludes transfers amorig persons.

Postsecondary education: The provision of formal instructional programs with a curriculum designed primarily for students who have completed the requirements for a high school diploma or equivalent. This includes programs of an academic, vocational, and continuing professional education purpose, and excludes avocational and adult basic education programs.

Private school or institution: A school or institution which is controlled by an individual or agency other than a state, a subdivision of a state, or the federal government, which is usually supported primarily by other than public funds, and the operation of whose program rests with other than publicly elected or appointed officials.

Proprietary institution: An educational institution that is under private control but whose profits derive from revenues subject to taxation.

## Glossary

Racial/ethnic group: Classification indicating general racial or ethnic heritage based on self-identification, as in data collected by the Bureau of the Census or on observer identification, as in data collected by the Office for Civil Rights. These categories are in accordance with the Office of Management and Budget standard classification scheme presented below:

White: A person having origins in any of the original peoples of Europe, North Africa, or the Middle East. Normally excludes persons of Hispanic origin except for tabulations produced by the Bureau of the Census, which are noted accordingly in this volume.

Black: A person having origins in any of the black racial groups in Africa. Normally excludes persons of Hispanic origin except for tabulations produced by the Bureau of the Census, which are noted accordingly in this volume.

Hispanic: A person of Mexican, Puerto Rican, Cuban, Central or South American, or other Spanish culture or origin, regardless of race.

Asian or Pacific Islander: A person having origins in any of the original peoples of the Far East, Southeast Asia, the Indian subcontinent, or the Pacific Islands. This area includes, for example, China, India, Japan, Korea, the Philippine Islands, and Samoa.

American Indian or Alaskan Native: A person having origins in any of the original peoples of North America and maintaining cultural identification through tribal affiliation or community recognition.

Salary: The total amount regularly paid or stipulated to be paid to an individual, before deductions, for personal services rendered while on the payroll of a business or organization.

Scholarships and fellowships: This category of college expenditures applies only to money given in the form of outright grants and trainee stipends to individuals enrolled in formal coursework, either for credit or not. Aid to students in the form of tuition or fee remissions is included. College work-study funds are excluded and are reported under the program in which the student is working. In the tabulations in this volume, Pell Grants are not included in this expenditure category.

Scholastic Aptitude Test (SAT): An examination administered by the Educational Testing Service and used to predict the facility with which an individual will progress in learning college-level academic subjects.

## Glossary

Technical/professional fields: A group of occupationally oriented fields of study, other than engineering and computer science, which include agriculture and agricultural sciences, architecture, communications, health sciences, home economics, law, library and archival sciences, military sciences, parks and recreation, protective services, and public affairs.

Tultion and fees: A payment or charge for instruction or compensation for services, privileges, or the use of equipment, books, or other goods.

## Type of higher education institutions:

4-year institution: An institution legally authorized to offer and offering at least a 4 -year program of college-level studies wholly or principally creditable toward a baccalaureate degree. In some tables a further division between universities and other 4 -year institutions is made. A "university" is a postsecondary institution which typically comprises one or more graduate professional schools. See also University.

2-year institution: An institution legally authorized to offer and offering at least a 2 -year program of college-level studies which terminates in an associate degree or is principally creditable toward a baccalaureate degree.

Undergraduate students: Students registered at an institution of higher education who are working in a program leading to a baccalaureate degree or other formal award below the baccalaureate such as an associate degree.

University: An institution of higher education consisting of a liberal arts college, a diverse graduate program, and usually two or more professional schools or faculties and empowered to confer degrees in varicus fields of study.

Work-study: A generic term for programs designed to provide part-time employment as a source of funds to pay for postsecondary education as well as a federal program that is administered through postsecondary institutions.

Year-round, full-time worker: One who worked primarily at full-time civilian jobs for 50 weeks or more during the preceding calenuiar year.

[^0]:    Editors: Gerard Devlin and Margery Martin
    Cover design: Phil Carr

[^1]:    NOTE: These acknowledgments recognize only those who helped develop new indicators for this edition and who helped update indicators repeated from earlier editions. Mention is not made of those who contributed to the initial develcpment of continuing indicators and who were identified in earlier editions.

[^2]:    'Not all indicators published in the 1990 Condition of Education are in this volume. Indicators for which no new data are available are generally not published (Indicator 2:24 is an exception). In this way, room is created for other indicators for which new data has become available. The index provides a reference for indivators in the current and previous editions of the Condition of Education.
    ${ }^{2}$ These observations are based primarily in The Condition of Educiation, 1991, Volume 1, Elementary and Secondary Education.

[^3]:    ${ }^{3}$ A substantial fraction of Hispanics 25 to 29 years old are recent immigrants to the U.S. and have little education. Thus, high school graduation rates for Hispanics as a whole combine the lower averages of the foreign-born Hispanics with the higher averages of the U.S.-born Hispanics. It is not known whether high school graduation rates have increased for U.S.-born Hispanics.
    ${ }^{4}$ Although finishing high school is not a prerequisite for admission to many colleges, particularly 2-year colleges, only 2.4 percent of undergraduates have not finished high school (U.S. Department of Education, National Center for Education Statistics, Profile of Undergraduates in American Posisecondary Institutions, December 1989).
